"PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON."

(Second Series.)

JOHN TYNDALL,

PIONEER PLANTER, VOYAGER AND EXPLORER; ALSO AS "JACK TYNDALL"—HUMOURIST AND RACONTEUR

THE subject of our Memoir—universally known among his many friends, and indeed all over Ceylon, as "Jack Tyndall"—was educated at Elizabeth College, Guernsey, and H.E.I.C. Military College, Addiscombe. He came out to India in February 1845, and in the same year crossed over to Ceylon. He lived with Mr. G. S. Duff, Manager of the Oriental Bank, Colombo, for a month, and then took up a post on Sir John Wilson's estate, Nilambe, as assistant under Mr. Louis Bird, where he remained for three years. Writing of this time, Mr. Tyndall says:— "My bungalow was called Polkavilla. In those days I did not kill myself with work, taking life remarkably easy, and I was much appreciated in consequence. These three years, I may say, were the happiest of my life; and I always look back to them with a feeling of great pleasure, and to my *Peria Durai* and his charming wife, Annie Bird, I attribute most of this by being thrown into their society." Towards the middle of 1848 things began to look very "blue" and depressing in Ceylon; the value of Coffee depreciated; failures of well-doing and respected firms in Colombo and Kandy shook confidence in the Island's prosperity, followed a short time after by what was called the "Kandyan Rebellion," which might have been squashed—says Mr. Tyndall—by a dozen policemen, but led to troops being sent from India, and a foolish panic. "It was about this time that I went down to Galle for the purpose of meeting my sister and brother-in-law who were on their way to Hongkong. The steamer they were coming out by (P. & O., of course, the only line) broke down somewhere on the Alexandria side, and my stay was protracted from day to day in expectation of the Suez steamer's arrival. (There was no telegraph in those early days.) Bogaars Hotel was then the chief hostelry ('Grand Oriental' not dreamt of), and though the proprietors did their best, the *cuisine* was not quite up to the mark, and with the house full of passengers, supplies fell short and complaints became day by day more aggravating. Amongst the hotel guests awaiting the steamer were Mr. W. W. Cargill, the chief originator of the Oriental Bank Corporation, Limited, and Mr. W. Ayrton, then a renowned Bombay lawyer, on his way to Calcutta, and who afterwards became M.P. for the Tower Hamlets, and Commissioner for Public Works in the Palmerston-Gladstone Ministry. As I had become very intimate with them, one evening when the conversation had again turned on the wretched food supplied, I said, 'Do you like snipe? for I know there is some good shooting in the paddy-fields away from

here, and I'll be bound to get some, and we will have a rare snipe curry.' 'By jingo,' said Ayrton, 'nothing could be better, Cargill and I are going out at daybreak to visit Paradua,' (then Lord Elphinstone's Sugar Estate). 'We will drop you by the way at what you may fancy is likely ground, and call for you at the same spot, and bring you back to Galle with, I hope, a good bag of snipe.' To all this I agreed, and having borrowed a gun from one of my Rifle Officer friends, and a good stock of ammunition, I joined my two new friends at gunfire in the morning, and after driving about 6 miles, I saw some very snipy-looking fields, got down, my companions promising to call for me about 11 o'clock on their way back. As I anticipated the birds were numerous, and I had capital sport, bagging altogether some 18 couple. Crossing the fields, in making for the high road, I got into a treacherous bit of green stuff, and before I knew where I was, I was up to my armpits in a kind of quicksand. After great trouble, with the assistance of some natives, I was extricated, nearly losing my gun, but relieved of my trousers and the boot and sock on one foot. In fact, when I regained the high road, I stood in a shirt, a short jacket, and one sock and one boot; and pretty well covered with baked mud over everything. The heat being fearful, I don't know how many *kurumbas* I drank, they were past counting. Presently, Cargill and Ayrton appeared, who nearly fainted with laughter at my appearance; but vowed and swore they would take the snipe in, but as for taking me it was impossible, they couldn't tolerate the idea. However, I rose quite equal to the occasion, and swore that if they didn't take me I would shoot their blooming horse if they attempted to drive off; so at last we came to a compromise, and we drove to Galle. On getting there we found the Australian boat had come in, and the verandah full of passengers. My two friends 'nipt' out like 'long dogs' fearing my presence. I called one of the *Appus* and told him to bring me one of his cloths. Getting this well wrapt round me toga-like, I descended from the trap with the huge bundle of snipe and gun, and at once became the cynosure of all eyes.

"This adventure had such an effect upon Cargill, that he told me he would give me an appointment in the Oriental Bank Corporation in Calcutta, and that I should go by the incoming steamer then overdue. That Ceylon and its planting business was a thing of the past, and he had taken such a fancy to me that he would push my fortune in a better enterprise. Of course, I jumped at the idea, wrote off some wonderful letters to dear old Louis, telling how I was situated, to all of which I in due course received replies congratulating me on my desertion, and wishing me all sorts of luck, but I felt very guilty when I found myself next day on board the 'Ava,' and leaving all my much-loved friends behind, ignorant of my whereabouts. In due time we arrived at Calcutta, and I was made Deputy Accountant with R400 a month. The position into which I had been hoisted, and my fitness for it, cannot be better described than in the remarks made on the subject of the Oriental Bank Corporation by some scribbling Baboo in the *Englishman.* After praising up the noble building in Tank Square, its Manager, and Sub-manager to the masthead, he proceeded to vent a torrent of abuse on the Accountant, who, he said, called the native clerks under him 'Soors' and various other terms of reproach unfit for publication. He then proceeded to tackle the Deputy Accountant (myself). 'The Deputy Accountant doesn't know the Debit from the Credit side of the Ledger (perfectly true). He has lately purchased an air-gun, with which he destroys pariah dogs from the verandah of this institution, thereby bringing much disgrace on himself and compatriots.' After some eight months of routine work, diversified by trips to the Sunderbunds, Budge Budge, and much festivity with old Addiscombe 'pals' at Dum Dum and Barrackpore, with occasional high jinks at Chandernagore, orders came over from Bombay to send somebody up to Tirhoot District to take charge of the produce in two large factories, which had been mortgaged to the Bank, the owner Colonel Pugh having failed. So, as I had some experience in Coffee, it was at once pronounced that I had an intimate knowledge of Indigo, Sugar, and Opium, and they appointed me to this duty, at which I was only too delighted, and a merry time I had in the Mozufferpore District, and fortunately acquitted myself admirably, more by good luck, than good management. A short time after my arrival, I had to render an inventory of all the Factories' belongings. This I did in great style, ending the list with 'Also an Alligator stuffed, 18 feet long, well suited for a Museum.' This fetched the Bombay Directors immensely, especially Harry Gordon. Having sent off to Calcutta a large instalment of produce, I proceeded with my excellent friend, the Manager, for a couple of months' sport in the Terai, where I saw the tiger for the first time, and had a most enjoyable trip. Shortly after my return, I sent off all the remaining produce and returned to Calcutta.

"By that time the Bank authorities had come to the idea that Nature never intended me for a Banker, so they supplied me with a 'Licet migrare' and 6 months' pay; so I travelled down to Madras, and stopped with my uncle who then was commanding the Queen's Depôt at Poona.

mallie, and was afterwards Sheriff of Madras. When there I met a man who had brought over horses from Australia, and after a time we became great friends. He proposed that I should join him in the purchase of a small craft to take back his three grooms to Melbourne, then proceed to his station in Brisbane, and then go to the South Sea Islands to load up with sandalwood, and then sail for China to sell it. Well, whether the 'Bittern,' a schooner of 45 tons' would not sail, or how it was, we were 126 days at sea, the last 22 days living on a wineglass of boiled rice per man (12 all told), but we had plenty of sugar, all other provisions had given out, some being damaged and thrown overboard. After being nearly wrecked in Shark's Bay on the north of Western Australia, we at last dropped our anchor off Freemantle, and there my journey came to an end, as after some weeks, whilst refitting 'the Bittern' which was all gone to pieces, I met my first wife, the daughter of the late Colonial Secretary of Western Australia, Peter Brown. We were married on the 1st August, 1850, and embarked shortly after for Madras; from there after some weeks' stay I returned to Ceylon, and here begins the second episode of my Ceylon life. I may as well add here that my friend and companion on the 'Bittern' got safely to Brisbane, and afterwards sold her in Sydney, and the last of her was on some reef off the New Hebrides. He afterwards went into business in Burma, and died there and a more cheerful and unselfish companion, upright and honourable, never lived than William Birrell. Peace be with him.

"On my return to Ceylon I found temporary employment on the Kelliewatte estate, the property of Donald Steward, afterwards proprietor of Tyspane, Kotmale. Dimbula was then but little planted up. Adjoining Kelliewatte was Bogahawatte, the then property of Jack Bannister, and a most excellent neighbour he was. He afterwards married Miss Thwaites, a very charming woman. On this side of the Dimbula river, there were only in those days the Union estate managed by James Wright, and Niagara partially opened. On the other side leading towards Nuwara Eliya was Wattegodde, then the property of William Fairholme and W. Johnston; beyond that Radella, the property of Fred and Edward Palliser; and farther on Palla Radella the estate of Andrew Hunter, a fine noble fellow he was, and universal favourite with everybody. The Lonisa estate was cleared and planted in this year (1850-51) up to 300 acres by James Wright of the 'Union' for Messrs. Odier. Some 100 acres of the Med. decoombra forest had been felled by the Messrs. Worms, but for some reason they never planted it, allowing it to revert to chena; and a great deal of trouble it gave me in 1868 from its crops of weeds, when this magnificent property came into the hands of my employers, the Ceylon Company, Limited, after they took over Messrs. Worms' properties in 1863-64. I left Kelliewatte in March 1851, and became assistant to Frank Sabonadière on the North Division of Delta. There I remained until May 1852, when I bought Glenloch from Mr. Simson, a Bombay Civil Servant. Previous to this I was on the point of purchasing Pooprassie, Pussellawa, a large acreage, about 200 acres opened, stores, bungalow, &c., &c., for £1500! Messrs. Gray & Co, of Bombay, were either the Proprietors or Agents (I forget which), but I was told to go and settle up matters with old 'Billy Thompson,' their Colombo Agent. Duff advised me to beat him down on his £1,500 figure, and I got as far as offering him £1,450. 'No,' said old Billy T., 'the price is £1,500, and there is a man coming here at 2 o'clock to buy it at that figure, but *I want* you to buy it. Now,' said he, 'I'll lend you the odd £50 to complete the purchase, as I want to do you a good turn, and you will make a fortune out of the place.' But I would not consent to this kind offer on his part. At 2 p.m., Mr. Segar of the hotel came in and stumped up the £1,500 on the spot, and I believe he did make a fortune out of it. I think I gave £4,250 for Glenloch. Estates were then rather a drug in the market, but the prosperity of the Island was at this time (1852) on a fair way to recovery. In 1854 I sold some 380 acres of forest land (60 acres planted) to John Northmore, and left for England in May, returning to Ceylon in February 1855 to Glenloch. Shortly after my return I planted some 40 acres additional to this property. We had admirable neighbours round about us:—my dear old friend, George Shirreff, next door on Helbodde, Frank Sabonadière on Delta, Capt. Reddie at Huntley Lodge, Lyon Fraser on Tavellamtenne, and Jack Gordon (afterwards of George Steuart & Co.'s) on Wavendon. Besides these, Maurice Worms on Rothschild, Gabriel living chiefly in Colombo, and the 'Reverend John' on Melfort. Those were rare old days, and we saw much of one another, and nothing could equal the good fellowship which existed between us. Of all these there remain only Jack Gordon, and the 'Reverend John,' I believe, to show for the lot, always excepting John Northmore lately returned from Hatton very much alive. In 1856-57 I bought part of General Fraser's estate, Rangbodde, which I called 'Bluefields' after a Jamaica property of my uncle's. In the same year I was sent for by the Governor, Sir George Anderson, who informed me that he had received instructions from the then Secretary of State (Sir Roundell Palmer*) to do all he could to advance

* More likely Sir John Pakington ?—ED. *T. A.*

my way in life, either in the C.C.S. or the Rifles. As I thought I was too old for the latter, and indifferent to the former, I declined Sir George's offer with thanks, but at the suggestion of Rawdon Power, then Colonial Secretary, he insisted on my being made J.P. for the Kandyan Districts ! Whilst at home in 1854 I was offered a Commission to go to the Crimea, but my wife would not hear of it. I was also offered the Command of a Tug Steamer to tow vessels up the Dardanelles, whereby a lot of money was made ; so much for chances in that noble profession which I never studied :—'The art of getting on in the world.' During Sir Henry Ward's time I had the honor of receiving great kindness at his hands, and his last words to me on his leaving Government House to embark for Madras were :—'That as soon as he could, he would give me the best appointment he could.' Alas ! at the end of another month he was no more, and the Government of India lost a great statesman and an able Governor when he died, and one who would have made a great name in India.

"A short time after this I sold Bluefields, and left for England. In 1864 I came out to Madras and had charge of large properties on the Nilgiris.* Having on several occasions from my love of sport hazarded shooting trips into the most deadly malarious jungles, from which my health suffered to such an extent that I was only too glad to return to Ceylon, and taking charge of Meddecoombra, which then had 300 acres just planted, and which before I left grew to 1,500. At the end of 1870, I was made one of the Inspectors ("V.A's") of the Company, Mr. William Rollo being the other. I held this office until I left for England in 1884, terribly broken down in health. In 1870 I accompanied H.R.H. the Duke of Edinburgh on a shooting trip to the Trincomalee jungles, and received Sir Hercules Robinson's full approval !—and nothing else. I returned to Glenloch as a residence in 1870, and went home on six months' leave, in 1875, losing my beloved wife, a few days after landing, from bronchitis. I returned to Ceylon with my two daughters in the following November. In 1878 I came home for a few months to marry my present wife who was Miss Laura Darby, of Leap Castle, King's Co. Ireland. By my first wife I had four daughters, one of whom I lost in Ceylon in 1878. By my present wife we have four sons, and a daughter. It is a great wish of mine to return to Ceylon for a couple of months and revisit old scenes. Alas ! I shall find but very few of the friends of the olden days, but from the few that are left I do not doubt I should receive a hearty welcome. I can look back to my days of coffee planting in Ceylon with the greatest pleasure, for I enjoyed the life thoroughly."

*It was from this quarter that a Colombo businessman got an answer to certain enquiries from Mr. Tyndall, by telegraph, in a form which became a common saying in Ceylon for many years, namely, "What a world it is, Mr. Venn!"—ED.

So closes the neatly written *MSS.* sent us by Mr. Tyndall ; but he added below :—"I daresay I "could write a good deal more, but I must be con- "tent with a skeleton sketch of one who enjoyed "life socially, never had an enemy, but made many "true friends. By-the-way I forgot to say that I "was dreadfully ill in 1872 and went to Australia "for three months." We well remember that illness : Wm. Grant of Dikoya, very ill, occupied one end of the hospitable bungalow of John Lewis Gordon, in Steuart Place, Colpetty, when John Tyndall, supposed to be dying from abscess in the liver, was brought down from Pussellawa and placed in the opposite wing. His wonderful constitution and the indefatigable nursing of his devoted wife pulled Mr. Tyndall back from the grave, while Mr. Grant sank under his fever attack. Then the great object of all was to prevent Tyndall from realizing that his dear friend Grant had gone, lest it should depress and throw him back. This avoidance and all about the funeral were managed without the remaining patient having any suspicion. We were at Galle when poor Tyndall came down to take steamer to Australia : he was miserably weak and thin, but would insist on sitting about the centre of the big table where some 150 passengers were dining. Each course he had to refuse ; but still the servants pressed until, overcome at last, Tyndall so shouted, "No ! didn't I tell you" as attracted all eyes, but made him free of worry for the rest of the evening. He came back, after three months' absence, quite another man. One of the incidents we recall of his Visiting Agent days was his bringing to Colombo, and specially to the *Observer* Office, the news of Mr. Slorach—a well-known Engineer and Coffee Store Manager—having picked up a magnificent gem on his estate in Haputale, a stone of the finest water which he was bringing to Colombo, and that he (Mr. T.) had seen it. By-and-bye Mr. Slorach turned up, full of the fun, his gem being a big lump of "lime-stone"—considered so valuable on a coffee estate, however, as to well deserve the epithet of "precious stone." After leaving Ceylon finally in 1884, Mr. Tyndall was one of the earliest to open a London Agency for the sale and distribution of Ceylon teas, in conjunction with one or two more well-known Ceylon men, fixing his city headquarters in Billiter House. The Firm was said at one time to have the services of two baronets in securing orders and extending its influence. Then cam

a story to Colombo of a strange placard that our old friend had stuck up in the lobby of his office which had brought down a remonstrance and protest from a London policeman on the beat. By this time, Mr. Tyndall had become the "Raconteur" of the *Ceylon Observer*, and many a passage in his planting, hunting and roving days has he, from time to time, described in our columns. He also forwarded to us the printed "placard" which had been the subject of remark among his friends and accompanied it with the following:—

"The enclosed may be of use to you, so I lose no time in sending it out. No Policeman ever appeared here, except to ask for a Christmas Box. I am on the best of terms with the Force. You will find this admirable policy yourself.—Yours sincerely,

JOHN TYNDALL."

The placard itself ran as follows :—

NOTICE.

All Beggars and Pedlars entering this Office will be shot dead.

Mr. Tyndall continued to attend to his London business up to a few months ago when he was laid aside by severe illness, from which, again, recovery was deemed very unlikely, if not impossible ; but in a letter from him dated 6th May in the same clear neat hand, the writer was able to announce convalescence—after passing through severe influenza, pleurisy, &c—though he naively added : —" I naturally find that I don't pick up my "strength as I did when I was forty years younger. "However, with the constitution of a Wilson's "Bungalow buffalo, and a heart as young as a "two-year old, I hope to pull along a bit yet. I "am just going down to my brother-in-law's, at "Castle Fraser, Aberdeenshire, and with bracing "country air and the wine of the country, I hope "to be 'o'er all the ills of life, victorious'—imme-"diately if not quicker"—and he winds up by hoping, very shortly, to send a contribution from "*Raconteur*" for the *Observer*.

Well past the allotted "three-score-and-ten," it will be judged that Mr. John Tyndall is a wonderful specimen of the early Pioneer Planter and Sportsman in Ceylon. That his vigour and hearty good spirits may long continue will be the wish of his many friends in Lanka as of all readers of the *Tropical Agriculturist* and *Ceylon Observer*.

Agricultural Pests :

WITH METHODS OF PREVENTION.

BY MISS E. A. ORMEROD,

(LATE CONSULTING ENTOMOLOGIST TO THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND).

VI.

ORCHARD PESTS.

Attack of apple sawfly may be taken as an example of how easy it is, without observation, for an infestation which bears much resemblance to some other kind to escape requisite notice, *i.e.*, such notice as causes proper measures to be taken, instead of trouble and money being spent to no purpose on applications suited to another attack of which the chrysalis stage is passed in a different locality. Apple sawfly presence has long been known in this country, but so far as I am aware has been little observed, and it was not until the summer of 1891 that I had an opportunity of studying the characteristics. In many respects the attack of those caterpillars to the apple fruit much resembles that of the too well-known codlin moth catterpillars. It may, however, be certainly distinguished by the sawfly caterpillar having a greater number of sucker-feet beneath the body, that is, six pairs which, with the pair at the end of the tail, and the three pairs of claw-feet, make in all twenty. There is the further characteristic of the caterpillars possessing a most unpleasant bug-like smell. Thus they may be distinguished from the codlin moth caterpillar, the larva of the *Carpocapsa pomonella*.

With regard to methods of prevention. In the case of either of the attacks it is desirable to gather up and destroy prematurely fallen apples, which from their bored and injured state show that they have fallen from caterpillar presence within, and may, therefore, very likely be then infested. But beyond this, the chief means of prevention are on quite different principles. The codlin moth caterpillar (to a great extent), after leaving the little apples, creeps up the trees, and changes to the chrysalis state in crevices of the bark. The sawfly caterpillar, on the contray, goes down into the ground to form its cocoons. It is, therefore, needless to point out that any amount of scraping, washing, and cleaning the bark is merely money thrown away, if all the while the enemies against whom these operations are directed are lying from two to six inches under the surface of the neighbouring ground.

The turnip sawfly *(Athalia spinarum)* sometimes causes overwhelming mischief; but this is not a regular yearly attack, by reason of rotation of crops, and because in regular course of autumn cultivation the cocoons are thrown up, or buried beneath their natural resting-places. The progress of the injury is very rapid. The bright orange sawflies lay their eggs in slits sawn in the leaves. One female will lay over two hundred eggs. The eggs hatch in about five days; the time varies with the state of the weather; if warm and favourable, they will hatch sooner. The twenty two-footed grubs are greenish at first, then black, then slaty, and are full-grown in about three weeks, during which time they eat voraciously. They go down into the ground to change, and the new brood of sawflies in summer comes up, ready to lay eggs and start a new attack in about three weeks. With this attack we can, as with most others, do something by ensuring vigorous plant growth; but all methods that have been found useful to check attack will be found to be based on the special habits of the caterpillar. During its three weeks' life it changes its skin about once a week, and to manage this it must hold fast by means of the pair of sucker-feet at the end of its tail, to a leaf or stem, so as to have something to drag against in the struggle to get free of its cast coat. If it cannot do this it dies. Also it has only the

power of spinning a thread to let itself down, or to come home again by in passing alarms, during the first few days of its life. After that, if it falls to the ground, it can only return by crawling.

The remedies which are chiefly used all turn directly on these habits. The plan of driving sheep through an infested field, or of brushing the plants with boughs, either carried by hand or fixed on a scufflery or, again of dragging a cart-rope over the plants, all turn on endeavouring to make the caterpillars loose their hold, which we see amounts, with a large proportion, to the same thing as killing them outright.

As in the case of turnip flea beetle, various kinds of dressings may be of use, such as lime, &c., if applied so that they stick to the insect and leafage; and also all measures to keep the earth moist enough to run on a good crop, and keep the sawfly from enjoyment of the full light, heat, and drought, in which it delights, will be of service.

There is one other kind to be noticed, because it differs greatly from those just named in its habits. It is the corn sawfly *(Cephus pygmaeus)* which feeds more especially within the wheat stalks; and its presence may be partially known by the blasted ear. This whitish maggot has only the rudiments of the three pairs of claw-feet; and when its work of mischief to us is done, it rests for the winter in a silken case, very near ground level, in the sawn through stalk. To prevent attack recurring, it is a perfect treatment to gather together the infested stubble and burn it. This is an exception to the usual form of life and place of change of sawfly larvæ, and therefore must be treated differently; but thero is the same principle to be followed as with caterpillars and chrysalids of other kinds of sawflies, and also of butterflies and moths; that is, firstly, to find out where they pass the winter, and then to turn them out from their shelters.

The amount of injury caused by sawfly caterpillars, and especially from time to time by those of the turnip sawfly, is so serious that a great deal has been written (of more or less use) on the subject; but in the short notes of the five kinds of attack mentioned above, it will be seen that whether as infestors of the forest tree or the garden fruit bush; as feeders within the firm fruit of the apple, or on the succulent leaves of the turnip, or carrying on their injurious work hidden within the growing wheat-straw; or, again, whether the larvæ or caterpillars are possessed of 22 or 20 feet, or (for practical purposes) of no feet at all, there is one method of prevention applicable to them all—to turn out the cocoons and destroy them.

The families of the parasite wasp-flies are important to us, as a means of keeping the increase of other insects in check. One division of these is that of the Ichneumon flies. These are much like the Ichneumon parasite of the corn sawfly. They are lightly-made insects, with a longish body and abdomen; long legs; a small head with long horns, often having a ring of white on them; and an ovipositor, sometimes short, sometimes long, and often permanently extended like a large and long sting. With this they insert their eggs, for the most part into the grubs of other insects, but sometimes into their eggs, and occasionally into the chrysalids; and those kinds furnished with long ovipositors pierce with them through bark or solid wood, and thus insert their eggs into beetle grubs, or whatever their selected victim may be, which, although out of sight, their instinct tells them is within, ready to act as food to their maggots; and thus they give us help which nothing else affords.

In the case of corn-ears which are infested by aphides, many of tho aphides, instead of being of the natural colour, green or yellow, brown or other tints, will be seen to be of a rich, brown, or almost black. These have been killed by the ichneumon. The female of the *Aphidius* inserts a single egg into abdomen of many aphides, one after the other, and the maggot, which hatches from the egg, consumes all that is eatable, until its live host is reduced to a state which will not carry on life any longer. Its uninvited guest goes through its changes within to an ichneumon fly, and presently quits the harened skin, which is distinguished, as just observed by its colour. Sometimes every aphis on a corn-ear is thus destroyed, and there are other kinds of allied parasite flies which help us similarly.

One of the forms of attack which is the plainest to be seen is that of the cabbage ichneumon fly. This little fly lays a vast number of eggs, sometimes more than sixty, in one caterpillar of the large cabbage butterfly. Here the maggots hatch and feed, avoiding by instinct such parts as the consumption of would cause a fatal loss, to the host, and, consequently, to the guest. The containing caterpillar—the live food, that is—meanwhile feeds and grows, not only until it attains its full size, but it may often be known from uninfested ones by its swollen appearance. It has not, however, power to turn to the chrysalis state: when the time for this comes, the maggots within pierce its skin, and each one spins for itself a small cocoon of yellow silk, in which it goes through its changes to the complete insect by the side of the dead body of the exhausted caterpillar. These little ichneumon flies are one of our protections against great increase of the caterpillars, and the small silken cocoons, which are easily seen when they lie together in masses on cabbage leaves, should never be destroyed.

Another kind of small ichneumon fly (*Hemiteles melanarius*), preys in the same way, by means of its maggots, inside the chrysalids of the greenveined cabbage butterfly. These infested chrysalids may be known by their dark brown colour, and should never be destroyed, as each one is a case—package, so to say—full of checks to a troublesome crop preyer.

All these ichneumon flies are very much alike in shape, and their wings are much veined.

The parasite wasp flies of the two other families, which are most important to us (*Chalcididæ* and *Proctotrupidæ*), are, for the most part, very small, with almost, or quite, veinless wings. The *Pteromalus puparum* is one of the kinds which destroys chrysalids of the large and small cabbage butterflies. This very small fly is stated to lay its eggs on the outside of the chrysalis, as soon as it has cast off its caterpillar skin, and is still soft and tender. The maggots from these eggs soon hatch and eat into the chrysalis, and sometimes as many as from two hundred to three hundred live thus in one chrysalis, where they change to the perfect parasite fly, and come out soon in summer to continue the useful work. In winter some remain in the chrysalis.

The use of these *Pteromali* is well shown by their work in North America, in checking increase of cabbage butterfly.

The small white cabbage butterfly made its appearance (or, at least, was first observed there) at Quebec about 1859, and gradually spread and caused much damage, but, for several years no parasite appeared to check it. In 1871—that is, about twelve years after the appearance of the butterfly—it was announced that the parasite we are now speaking of had appeared: the British parasite had followed the British butterfly, and was doing its appointed work. In 1875 it (the parasite) had become quite common in the State of New York; and later on it was observed to be still on the increase.

The great benefit gained by natural helpers of this kind has caused it to be suggested that we should rear them. This matter seems rather hard to manage; also we do not often benefit much by upsetting the regular balance appointed; but it is often in our power to follow up a hint of this kind, by remembering that when an out-of-the-way insect enemy has appeared, we may very likely be able also to introduce its regular check and leave the results to follow in due course. Sometimes, also a new infestation may be traced home to the country from which it came by means of its accompanying parasites. In the memorable appearance of the Hessian fly in this country, we had no clue to lead us to the

knowledge of whether it had come from America of from the Continent of Europe, until examination or its parasites showed that, with the exception of one kind common to both continents, the others were not American, but Russian.

The parasite flies of wheat midge show the shape of two other kinds of these minute flies. The *Macroglenes*, of the family of the *Chalcididæ*, is supposed, from its habits, to destroy the midge-grubs; and the *Platygaster*, of the family of the *Proctotrupidæ*, has been watched in its operations of laying one egg in each midge-grub it attacks.

There are other kinds of parasites of nearly-allied kinds, which we have not space to enter on here; but the general principle of preserving a useful amount of them is so important that, though it is a very difficult matter to protect them, it is as well to be careful about setting on foot regular measures calculated to lessen their numbers. It may be doubted whether, in regard to help from parasitic insects, we do not suffer, rather than benefit, as much as is supposed, by *great* encouragement of birds. We cannot tell accurately what amount of the small parasite flies are taken as bird food, for their small bodies are probably soon digested; but it appears reasonable to suppose that as we know some birds take them, others also do so, and in this way do the reserve of helping. I would not for an instant suggest clearing away birds; but it would be well to bear in mind that the works of creation are founded on a principle of order, and of relationship of one part to another; and if we use such power as we may have to alter any detail, we are likely to suffer. We have altered the amount of food for insects by the enormous necessary increase in food crops; but it appears to me that to try to keep these insects in check by calling in birth-help in legions—which grub up the plants to be protected, and eat up the eaters of the insect foes, and likewise (when insect food fails the many mouths) betake themselves to the wheat-ears—is very much like bringing in the rats to drive out the mice.

The families of wasps, bees, and ants are included in another great section of this order, called the *aculeata*, because they, or most of them, are furnished with a sting, much resembling in appearance and pain of application a needle, known in Latin as *Acus*. These have been written on for so many years that we need not enter on them at length; but it is well to observe that the hive bees, the social wasps, and social ants, are remarkable for much of the work of the community being carried on neither by the males, nor as a regular thing by the large females, which are commonly known as queens, but by a large body of abortive females, or neuters, commonly known as "workers."

In the case of the Queen bee, we have a clear instance of the way in which different food and accommodation acts in altering, or rather, in fully developing the powers; and gain matter for thought, at least, from the fact that a precisely contrary treatment, such as compressing, starving, chilling, &c., brought about by common farming measures, will not (or probably may not) be without effect in stunting the growth and otherwise lessening attack.

PRODUCTS OF THE CITRUS TRIBE IN SICILY.

Reporting on the trade of Sicily, Mr. E. M. de Garston gives some interesting facts connected with the staple products, such as essence of Lemon and other produce of the Citrus family, the different trades dealing in these being of a very interesting character. The Lemon essence industry is a very important one in Sicily, where the abundance of raw material naturally renders the manufacture of the so-called oils of Lemon and Orange a very profitable undertaking; 37,941 kilos. of these essential oils were shipped during the year 1895, over 32,000 kilos. of which was taken by Great Britain.

Oil or essence of Lemon is obtained by pressing or bursting the oil-glands in the rind of the fruit, and this is done either by hand or by machinery; that obtained by the first process being by far the best in quality. In Palermo the essence is all pressed at night. The workmen are supplied with a certain quantity of rinds, divided into equal portions to each between so many gangs, each under the supervision of a foreman. Each man holds two sponges between the fingers of the left hand, and works the rind about in the best way to fracture the oil-vessels. This is caught in the sponges, which, when sufficiently charged with oil, are squeezed into an earthenware receiver; a considerable proportion of the product thus obtained consists of ordinary Lemon-juice left adhering to the rind, together with more or less of the Lemon-pulp. This, however being heavier than the essence, sinks to the bottom of the receptacle, and the essence remains on the top. As the first of these receivers becomes full, the workman blows the floating oil into the second jar through a species of channel formed in the side of the first, and when no more of the essential oil is transferable by blowing, the remaining essence which may yet be floating in the original receiver is carefully absorbed with a sponge, and thence squeezed into the second receptacle, which only contains pure essence.

The remainder, namely, the essential oil which may still have been left in the rinds, is by some manufacturers extracted by distillation, and forms a second quality of essence. By others, again, it is expressed by subjecting the partially exhausted rinds to mechanical pressure in bags. To ascertain, however, if the obtainable essence has been thoroughly squeezed out by the original hand process, the rinds are tested by a foreman, who presses the supposed exhausted peel into the flame of a candle, when, if any combustion is visible, it shows that the pressers have not done their work properly. The essence obtained by the foregoing process undergoes no further manipulation beyond being collected, and after careful filtration through filter-paper it is ready for shipment in the usual coppers of 100, 50, 25, 12, 5, and 2 lb. each. When freshly expressed it has a delicious smell of the fruit, which is greatly injured by distillation.

From the leaves, flowers, and fruits of the several species and varieties of the Citrus genus a large variety of products is obtained. The blossoms in their natural state serve to flavour drinks and sweetmeats. When distilled they yield two very much esteemed products, namely, orange flower-water and an essential oil known as Neroli. Moreover, when candied, they form a delicious sweet, much in vogue in some regions of Sicily. The orange flower-water is made of equal portions in weight of blossom and water, which yield on an average about one-fifth of the combined weight of water and flowers. Notwithstanding the abundance and excellent quality of the raw material, so to speak, still the best manufactories of Orange flower-water are to be found outside Italy. As to candied sweetmeat concocted out of the blossoms, it is doubtless more wholesome as well as more palatable than many other productions of the confectioner's art. The flowers in the first place are selected with care, weighed, immersed in cold water for twenty-four hours, after which they are dipped simply in cold water, rewashed in cold, and finally spread out on a linen cloth or sheet to dry. When completely dry, they are laid out in low, wide dishes, each flower separate from its fellow, and are then sprinkled with double their weight in sugar, administered at intervals during a period of eight days or thereabouts. Moreover, during the same period the flowers should be frequently moved and kept in the shade; at the expiration of this time they are once more placed in the sun, whose rays dry them completely.

The raw juices of all the different varieties of the species of Citrus, except that of the Bergamot, are available for commerce; but the juice of the Lemon is the more highly prized, on account of the greater amount of acidity it contains. But the raw juice,

"Agro-crudo," however rich in acid particles, can never vie in this respect with the same juice in a concentrated form with the "Agro-cotto," in which form it enjoys besides a great superiority over uncondensed juice in durability and in reduction of volume. This concentrated juice is prepared in the following manner. It is first of all clearified by being left to stand, then boiled in large cauldrons of tinned copper, one-third full, and the boiling liquid frequently stirred with an iron rod having its head wrapped in common canvas, or in rags which have thus to keep the bottom of the boiler clear of all sediment; those necessary additions to the boiling liquid which the constant evaporation of the aqueous particles renders expedient are supplied by smaller supplementary boilers in which the liquid is kept sufficiently hot to hinder any interruption in the ebullition of the juice contained in the large vessels. When the required density is obtained, a point which is easily ascertained through the medium of the citrometer, it is poured into vats to cool, and finally drawn off through ordinary funnels into casks.

The adulteration of the acid or juice is facilitated by the ready absorption of certain well-known and easily-obtainable substances, which increase the weight of the acid-juice when concentrated. The most commonly employed substances for the purpose of adulteration are tartaric acid, chloride of sodium, and sulphuric acid. The methods employed in Sicily in order to detect the cheat, if not so scientific and perhaps less accurate than those in use in England, are at least inexpensive, simple, and sufficiently effective. Citrate of lime, which seems to be the safest form in which the acid principle can be conveyed, and is the substance whence the citric acid is directly manufactured, is now prepared to some extent in Italy, although up to within the last quarter of a century this preliminary process was considered impracticable from a remunerative point of view. A very well known authority on the subject laments in forcible terms the remissness and ignorance of his countrymen in Sicily, which alone permits foreigners. to reap that harvest which Italians neglect to gather and garner for themselves. The objections raised in bygone days, from the supposed impossibility of procuring at home a sufficient quantity of proper chalk, have been shown to be utterly mistaken wtth respect to the production of citrate of lime. Objections of a similar nature are now mooted with regard to the production of citric acid, and have been partially disproved already by the establishment of a British firm in Messina, which has undertaken successfully the manufacture of citric acid in conjunction with tartaric acid.

With regard to the essential oil industry in Sicily, it is said to be both widespread and prosperous. Essence producers and exporters are numerous. The essential oils are derived from all varieties of the Citrus group, though they differ considerably in quality, that expressed from Bergamot being the best, and then follow the Lemon, Orange, and Citron, the relative value of the essence being in inverse order to that of the juices.

The mode of payment of the workmen engaged in expressing the essential oils is peculiar. Instead of being paid at a fixed rate per day or hour, or for the weight or number of rinds expressed, he is remunerated according to the amount of essence he succeeds in extracting out of a given weight of rinds.

It is stated that, though the bulk of the oil produced in, and exported from, Sicily is quite pure, yet it is sometimes adulterated with other essential oils, and sometimes with turpentine, or even with resins. The occurrence of these adulterations seems to have discredited and unsettled the market value, so that it became necessary, or at least expedient, in some cases to submit it to analytical test before exportation. Owing to these precautions, the character for genuineness of the Sicilian essential oils has been redeemed, or rather maintained.—*John R. Jackson, Kew.—Gardeners' Chronicle.*

PLANTNG NOTES.

FRUIT FROM THE CAPE.—Since our last report the "fruit ships" have arrived from the Cape; the first, the "Scot" bringing 55 boxes of Pears and 294 boxes of white Grapes; the second, the *Avondale*, bringing in 559 boxes of white Grapes. We are informed that, with the exception of 30 boxes, these consignments turned out in good condition, and realised fair prices. The faulty boxes above noted were very over-ripe, and hardly saleable.—*Gardeners' Chronicle.*

LONGEVITY OF THE LARCH.—The *Chronique Agricole du Canton de Vaud* contains various records concerning the age attained in Switzerland by the Larch. There are at Mayens-de-Sion two old Larches which measure from 20 to 22 feet round the base. and 65 feet in height. Both are referred to in a plan of the grounds dated 1546, where they are mentioned as "the two Larches before the house." They were then a good age, and now are 351 years older. These years do not seem to have weakened them, as they are in full vigour. Another Larch is found on the Alp de Torrent, near Albinen; it is called the boundary-tree, as every hundred years the people of Albinen and Louécheles-Bains go out to it to re-mark the boundary. On its trunk a sort of niche has been cut in the bark, and on the exposed wood are engraven the dates from 1400 to 1700. Larch wood has considerable durability; the above journal mentions a châlet at Louéche-les-Bains where the piece of wood which supports the ceiling is of Larch, and bears the date 1536.—*Gardeners' Chronicle.*

INSECT POLICE.—We take the following extract from an article of Mr. R. C. Perkins, published in a recent number of *Nature*, p. 499:—"The first importation of Coccinellidæ to destroy hordes of scale-insect in the Hawaiian Islands was made in 1890, when Vedalia cardinalis Muls, a native of Australia, was, sent over by Mr. Albert Koebele. At that time many trees were in a deplorable condition from the attacks of Icerya, Monkey-pod trees being particularly badly infested—so much so that they were being largely cut down as the only recourse. The Vedalia was a complete success; it became perfectly naturalised, increased prodigiously for a time, practically cleared the trees, and then, as the Icerya became comparatively scarce, decreased in numbers, while at the present time it is evident that the number of the scale and its destroyer has arrived at a fixed proportion. Previously to its introduction here the same lady-bird had done excellent service in the fruit orchards of Lower California.....In many parts of the islands the Bananas and Palm-trees have been severely attacked by the larva of a species of Pyralidina. There is little doubt that in course of time this plague will be entirely kept under by a fine Chalcid (Chalcis obscurata, Walk.), introduced from China and Japan, which has already multiplied enormously at the expense of these caterpillars—so much so, indeed, that in many localities the trees have now entirely recovered. Again, within the last few years a Lamellicorn beetle (Adoretus umbrosus) has been introduced from Japan. This insect speedily multiplied prodigiously, and soon destroyed nearly every Rose-tree in Honolulu, and subsequently attacked the foliage of many other trees. The cultivation of Roses—once a feature of the city—became impossible; while a remedy seemed hopeless. One day, however, Mr. Koebele discovered a parasitic fungus, and by cultivation of this, and infecting healthy beetles, soon spread it far and wide. Whether the fungus will prove entirely effective is not at present certain, but in any case it will be a most useful aid. The writer has seen the ground under trees, which were attacked literally strewn with dead beetles—all killed by the fungus—and beneath the surface of the soil the larvæ had likewise perished. It is at least certain, therefore, that myriads of the beetles were destroyed very shortly after the fungus was spread around by the individuals that had been infected."—*Gardeners' Chronicle.*

THE MAYFIELD (DIMBULA) TEA CO. OF CEYLON, LIMITED.

Capital £100,000, in 5,000 6 per cent cumulative preference shares of £10 each (which have priority as to capital and dividend), aud 5,000 ordinary shares of £10 each.

Present issue—3,300 per cent preference shares, and 3,300 ordinary shares of £10 each.

The purchase of the following tea estates has been arranged, viz.:—Mayfield and Chalmers, situated in the Dimbula district, and the Nicholaoya group, situated in the Matale district, comprising the following acreages and particulars:—

Estates.	Tea over five years.	Tea over three years.	Tea not yet in bearing
Mayfield ..	404 Acres.	12 Acres.	— Acres.
Chalmers ..	260 ,,	—	30 ,,
Nicholaoya ..	312 ,,	87 ,,	48 ,,
	676 ,,	99 ,,	78 ,,

Estates.	Tea total.	Cardamoms.	Timber planted.
Mayfield ..	416 Acres.	—	36 Acres.
Chalmers ..	290 ,,	—	—
Nicholaoya ..	447 ,,	15 Acres.	—
	1,153 ,,	15 ,,	36 Acres.

Estates.	Forest.	Chena and Patana.	Total acres of estates.
Mayfield ..	88 Acres.	36 Acres.	576 Acres.
Chalmers ..	10 ,,	57 ,,	357 ,,
Nicholaoya ..	400 ,,	409 ,,	1,271 ,,
	498 ,,	502 ,,	2,204 ,,

Mayfield and Chalmers are taken over as from the 1st of January last, and Nicholaoya from the 1st of July, 1896, the Compauy taking the benefit of the produce from these respective dates. The production of these estates for the current season is estimated at not less than 421,000 lb., which with the cardamons may be expected to yield a net revenue of £5,450. As, however, there are 177 acres of tea not yet in full bearing, and as there is still a considerable area available for the planting of tea, the out-turn should be considerably increased year by year. The Company will acquire the three estates, machinery, and buildings for the sum of £63,000, the price fixed by the Vendor, which is considered not an excessive price, cousidering the good reputation of the estates. After payment of the purchase-money there will be left the sufficient sum of £3,000 for the general purposes of the Company. The Vendor pays all expenses of every description down to allotment. Taking the value of the uncultivated area and cardamoms at £5 per acre, and deducting the £3,000 for general purposes, the purchase price of the area under tea works out at about £50 per acre.

EDERAPOLLA TEA COMPANY OF CEYLON, LIMITED.

The followiug is from the report of the board of directors, to be presented to the shareholders at their first annual ordinary meeting to be held at the offices of the company, 16, Philpot Lane, E.C., on the 13th inst: -

The directors have pleasure in submitting to the shareholders the report and accounts of the company for the year ending December 31, 1896. The company was incorporated on November 29, 1895, and the prospectus issued on December 3, when the applications received for shares were far in excess of the number offered for public subscription.

Since the company acquired Ederapolla and Ardross Estates sundry native lands have been purchased, and the total acreage is now as follows:—Tea in full bearing, 471; partial bearing, 81; not in bearing, 48; clearings, 87½; Jungle, 189; Paddy Field, 7; Paddy, and Scrub, 10½; total, 894. The total crop secured amounted to 358,324 lb. of tea, being 48,324 lb. over the estimate, and the average yield of the two estates was 640 lb. per acre. On Ardross 11 acres and on Ederapolla 38½ acres of jungle have been felled and burnt off for planting this year, and on both estates there are fiue nurseries with abundance of plants for the company's requirements. The directors have had very satisfactory reports on the estates from Mr. Thomas Smith, of Barnagalla, who in his report of January 26 last, writes as follows:—"I consider the estates throughout the whole year have been worked to the very best advantage under the able management of Mr. Watt," and it affords the directors pleasure to endorse and confirm the opinion thus expressed of the services of their general manager. The company's net profit for the year amounts to £2,795 15s 10d; and this it is proposed to appropriate as follows:—Amount as above, £2.795 15s 10d; interim dividend of 5 per cent paid in September, £1,100. It is now proposed to pay a final dividend of 5 per cent (free of income tax,) making 10 per cent for the yoar, £1,100, aud to write off half the preliminary expenses, £300 8s 1d; leaving a balance to carry forward of £295 7s 9d. In accordance with the articles of association, Mr. G. W. Paiue retires from the board, and, being eligible, offers himself for re-election. Messrs. Cape and Dalgleish also offer themselves for re-election as auditors.—*H. and C. Mail*, April 2.

BANDARAPOLA CEYLON COMPANY, LIMITED.

The following is from the report of the board of directors, to be presented to the shareholders at their fourth annual ordinary meeting, to be held at the offices of the company on Wednesday, 14th inst.:—

The directors have now the pleasure to submit to the shareholders the accounts and balance-sheet for the year endiug December 31, 1896.

The net profits for the year in question amount to £2,438 3s 10d, to which has to be added £216 19s 4d brought forward from 1895 accounts, giving a total sum to be dealt with of £2,655 3s. An interim dividend of 5 per cent (free of income tax) on £16,000 paid in September, amounted to £800. It is now proposed to pay a final dividend of 5 per cent (also free of income tax) on £18,500, making 10 per cent for the year absorbing £925; and to write off for depreciation on old buildings and machinery £500; leaving a balance to carry forward to next account of £430 3s 2d.

During the past season the crops secured from the company's property amounted to 346,150 lb. of made tea aud 142 cwt. 3 qr. 13 lb. of cocoa, as against 182,512 lb. made tea and 80 cwt. 3 qr. 13 lb. cocoa for the previous year, an increase which the directors considered extremely satisfactory. The price realised for the tea shows a slight falling off as compare with 1895, being 6·432d, as against 6·788d per lb. The old tea on Baudarapola, 286 acres, gave 867 lb per acre, and that on the 98 acres of Muendeniya land, only three years old, and raised principally from seed at stake, has giveu 718 lb. per acre, a phenomenal return, and the 1895 plauting promises equally well. For the current season the directors have sanctioned a further clearing of about 50 acres to be planted in tea, and this is being proceeded with by the Ceylon manager. During the severe rain storms experienced in the latter part of 1896 the foundations of the wheel-pit at the factory were carried away, the wheel-pit subsiding, and the wheel being considerably damaged. The directors are glad to report, however, that, through the energy and promptness of the Ceylon manager, the damage was to a great extent minimised, and they take this opportunity of recording their appreciation of the euergy and capacity for overcoming difficulties displayed by Mr. Andersou under very trying circumstances. They are also iudebted to the managers of neighbouring estates for their kind assistance on that occasion. All the damage has been repaired, and the erection of an engine and boiler

tasters, and has been sold at full market prices. It need scarcely be said that the experiment was due to British enterprise and capital.

AND IN VARIOUS COUNTRIES.

Much the same thing is going on in Johore, but it is obvious that such undertakings must feel their way warily. Natal has not yet entered the market as a tea-producing colony; but planting on a small scale has been carried on there for some years, the output, which s of good strength and flavour, being locally disposed of. From Java to Jamaica is a far cry; but while most persons have heard of, if not tasted, the tea-grown in the former, few are aware that the plant once evinced a considerable liking for the soil and climate of the West India island. Experiments on an extensive scale are now being carried out in Brazil, the planters of which country are said to be fully convinced that tea can be profitably grown there. But the suggestion appears to have been first made, and the necessary capital found, by British residents, who have long had the subject under consideration, and who appear to have satisfied themselves of the hopefulness of the prospect. Both soil and climate are regarded as exceptionally favourable, as are the general conditions and cost of labour—the latter, indeed, being commonly the crux of the whole question. In their mere "tea-producing qualities" the provinces of Rio de Janeiro and Sao Paulo are spoken of as being fully equal to Ceylon, and satisfactory results have already been obtained from some of the plantations.

IN CALIFORNIA.

But the most interesting, and not perhaps the least promising, of recent trials in this direction are those which have for some time been in progress in South Carolina, under the auspices of the United States Department of Agriculture. Probably the first tea-bush grown in America was planted near Charleston by M. Michaux, a French botanist, in 1804. The failures to develop from this starting-point anything in the shape of a settled industry have been hitherto almost continuous. But there nevertheless exists a confident belief in America that all the tea required there will ultimately be produced in that country. Every fresh effort is regarded with enthusiasm, though the main hope seems to be based on the fact that the flora of the chief tea-producing countries of the East largely finds its counterpart in South Carolina. The tea grown there has proved of good flavour, but somewhat lacking in the "body" to which the wide use of Indian tea has accustomed ourselves. This, however, is considered to be less due to climate or soil than to a defective method of treating the leaf during the manufacturing stages. The necessary tea-seed is still imported from Asia, and the American Consuls at the Eastern tea ports are instructed to spare no efforts to secure the best that can be obtained. All these operations, therefore, can only be regarded as still occupying the experimental stage; and the same must be said of many successful trials of the same kind now going forward in Australia, Tasmania, and New Zealand.

THE LABOUR QUESTION.

For, to quote a local opinion, "there is labour to bestow on such a cultivation"—that is to say, no labour at the low rates of payment which only could be offered. And this is the governing condition of the entire question. Considerably more than a million native labourers are employed in the tea-growing industry of India and Ceylon, the pay of a coolie being about 8d. a day Women and children receive from 4d. to 6d. The rates are equally low in China and Japan. It is obvious that European—still less British—labour cannot be diverted to tea-growing on any soil with the smallest prospect of financial success. The work of planting and manufacturing is neither heavy nor exhausting, and may be regarded as almost the natural heritage of the comparatively puny races engaged in it. Anglo-Saxon muscle and energy must find an outlet in other directions. Whether the Russians will succeed with their imported Chinese labour is an interesting question which time alone can answer. A new taste may ultimately prevail in regard to the flavour of tea, and more delicate growths, yielding perhaps less body, again come into fashion. Commercial enterprise can be trusted to note any such change, but the close of the nineteenth century sees the tea industry of British India and Ceylon still steadily progressing.—London *Standard*.

ECHOES OF SCIENCE.

The exploitation of the "Kiekxia Africana," a rubber-bearing tree, promises to be important for the West African Colonies. At Lagos the milky juice evaporated gives a superior quality of rubber. All the colonies of the Gulf of Guinea possess this tree.

White mustard has been tried as a forage for cattle in Tunisia, and found to do well. It is relished by cattle, and contains a good deal of nourishment (88 2 per cent of water, 2·6 of proteic matter, 0·41 fatty matter, 2·4 matter soluble in alcohol, 1·7 of starch, and 2·4 of cellulose with mineral matters).

With reference to "Manna," Mr. Timothy, of Tooting College, cites a passage in Daniele Bartoli's "Asia," where he describes the island of Ormuz as a barren waste without even thorns or birds—" but every morning a dew falls, which congeals into grains, has a very sweet taste, and is called "Manna." The tamarisk (manifera) grows in Arabia on sandy soils and brackish shores; therefore, Mr. Timothy thinks the manna of Ormuz may have been blown to the island from Oman, on the eastern shore of Arabia, across the Persian Gulf. This appears to confirm the belief that manna comes from the tamarisk, and is not a lichen.

PRODUCE AND PLANTING.

CHINA AND ITS TEA MANUFACTURE.—Every rumour about the awakening of the Chinese to the task of improving their position in the tea markets of the world naturally attracts attention in India and Ceylon. Is China about to start on a fresh tack, and use those imitative faculties with which the nation is credited?

The tea market has been won by Indian and Ceylon planters, and it must be held against all comers. There is undoubtedly a movement in China towards putting the commercial house in order, but the Chinese move slowly, and every day lost to them strengthens the hands of those who now have dossession of the tea market.

BLENDED TEA.—We pointed out in a recent issue how expert tea blending has become a powerful factor in the tea trade, and that the art of judicious blending is cultivated very much more extensively now than formerly. The question of blended tea is one, says the *Produce Markets Review*, which calls forth a considerable amount of attention and enterprise on the part of the grocery trade, the demand having increased to an extent little dreamt of a few years since. The phenomenal growth of the blended tea trade as a whole shows that it answered a great public want. As a matter of fact there is an increasing necessity for general traders, such as tho grocers have become, to buy everything ready for use. Further, the great fall in the price of tea and the consequent droportionate diminution of the retail profit upon it, have increased the disinclination of the grocers to continue the disagreeable operation of blending in their own place. Ordinary buyers also find that a very great saving in capital is effected by ceasing to hold heavy stocks in bond, especially as the latter often deteriorate in value as teas are now made. Again, in former years people had only to consider one market—

that for China tea. Now they have in addition to study Indian and Ceylon kinds as well, and owing to the enormous extent of some of the districts, especially in India, there are infinitely more varieties in the character of tea than used to be the case. While these facts impose increased difficulties in the way of retail blending, they at tho same time afford a far greater opportunity to the wholesale blender than he could possibly have had a few years ago; in fact, the increased number of markets and varieties gives just the opening required, and, coupled with the use of machinery and the other causes named above, mainly account for the increase in the trade. The standard for blending has also greatly risen and is more difficult for the retailers to meet, unless they work on a very large scale. Years ago ancestral methods of tea mixing were no doubt all very well; but they are useless in the present days of keen competition, especially as most of the teas and flavours that used to be the favourites are practically obsolete. The public may be left to judge for itself whether it is not the fact that the grocer in a fair way of business can supply, with a return to himself, teas 4d to 6d per pound, or say, 30 per cent, cheaper than those advertised at gigantic cost. Among the special points for the ordinary run of grocers to study in connection with this and other forms of competition is undoubtedly the purchase of properly blended tea.

INSULT TO INJURY.—When will a revision be made of the interesting information given in official publications about tea. No product is so maligned as tea. Indian and Ceylon kinds are usually ignored altogether, but a correspondent calls attention to an extract from a "Manual of Military Cooking" which is more than ordinarily awful. "Tea: That usually purchased for the Army is black congou from China, and of good medium quality. The following is a favourite and inexpensive mixture:—1 lb. of Moning congou, ½ lb. of Assam, and ½ lb of orange pekoe. *It is often adulterated by the addition of the horse-chestnut, elm, willow, poplar, sloe, hawthorn, &c. Of these, the only leaves resembling it are those of the willow and sloe.*" Shades of Assam pioneers—the bare suggestion of sloe leaves and horse-chestnut in the same paragraph with Assam; but perhaps the compiler of this archaic stuff has lively remembrance of the cheap China tea once in vogue.—*H. and C. Mail*, April 2.

CACAO AND COCOA BUTTER.

LONDON, April 1.

This letter ought properly to be headed "Club-Echoes and Cocoa Nibs" this week, for I have heard a good deal more about

COCOA

than tea during the last two or three days, having been in the company of a cocoa expert during a great part of the time. The cocoa manufacturers are all on the *qui vive* at present, a certain new maker whose name must be familiar to every person who opens any newspaper, but need not here be more explicitly referred to, having arisen among them, who is advertising so extensively and so unblushingly that all the old established firms are "sitting up" as the saying is. This gentleman or firm rather I suppose, for it is freely asserted there is a company behind, is calculated to be getting £20,000 a year by the sale of a brand of cocoa he pays £40,000 to advertise, and the consequence of this tremendous advertisement is that retail dealers are deluging the old established manufacturers with letters telling them as Demetrius id of old, that their trade is in danger. However, as my informant said, "working at such a heavy loss can't go on *very* long in the nature of things, and *ultimately we will all benefit* by this immense booming of our article." This remark struck me as bearing on the great question of tea advertising so frequently referred to in the *Tropical Agriculturist* and I started on an enquiry as to how cocoa was pushed in new countries eliciting the following information which may be interesting. "When we introduced our cocoa into America," said the expert, "I gave our man a year to do it—to his disgust rather, for he had not been anticipating such a prolonged time of it over there, but—it was a year and a half before he got back. He travelled all over the states opening cocoa shows and starting demonstration lectures in every good-sized town, as well as advertising liberally in the papers. He couldn't work by advertisement alone. You need to show the good folks in America in a practical manner that what you've got to sell is worth buying. Now we've established a good market over there, and cocoa, which in this country in 1861 was only used in the proportion of one-eighth of a pound yearly per head of the population, is now gone up to rather more than a half of a pound annually per head. The advance of cocoa is slow certainly in comparison with tea, but it has all along been wonderfully steady. Another thing—the sale of *pure* as opposed to adulterated cocoas has also grown steadily. The public are beginning to know what good cocoa means now, and won't drink the mixtures of sugar starch and potatoes that used to be sold for cocoa."

In regard to the sale of

COCOA BUTTER,

which is an article in considerable demand among the sweets manufacturers, it is rather curious to note the effect of the recent duty on the import of the butter into this country, a duty that was intended entirely to benefit the home manufacturers, but which has had precisely the opposite result. The duty has raised the price by two-pence a pound to the home manufacturers and chemists, who were dependent on the foreign makers for their supply, and has cheapened the market for the foreigner in his own country.—So much for protection.

PROGRESS IN STRAITS.

KINTA.—Agriculture is making gradual but steady progress throughout the district. There are now seven estates alienated to European planters, and negotiations are pending for the granting of several other important concessions. Almost all these estates are being taken up for the cultivation of Liberian coffee, which has also been extensively and successfully planted upon land held by natives in all parts of the districts.—*Report, Commissioner of Lands*, 1896.

B. C. AFRICA: TANGANYIKA.

Mr. John Gibbs, manager of the African Lakes Corporation, Ltd., recently returned from a journey to Lakes Tanganyika and Mweru. We are informed by Mr. Gibbs that he went up Tanganyika as far as Ujiji. It is probable that Mr. Andrew Law, the Company's agent on Tanganyika, will next May make a voyage up to Ujiji and the north end, and inland from there towards Lake Victoria Nyanza, so as to obtain particulars about the route from Tanganyika to Uganda. Mr. Gibbs informs us that while at Ujiji he saw English newspapers ted 24th October last, which had reached Ujiji

on the 3rd January, only some 72 days from London, which is a great improvement on the time taken in former days. We understand that the African Lakes Corporation are opening a store at Ujiji.

Mr. Gibbs also visited Lake Mweru, and, crossing that lake in Captain Weatherley's steel boat, spent a few days at Mr. Crawford's mission station in the Congo Free State.

On Saturday, the 20th February, a sale of cattle was held at Zomba, at which 90 beasts of various descriptions were disposed of, realising a total of £109. Cows with calves were sold for £2 each, heifers, 30s. each, bulls, £1, and bullocks, 23s.—*British Central Africa Gazette*, March 1.

WHAT THE PEOPLE DRINK IN AMERICA.

A great deal of loose talk is indulged in by many unknowing ones as to what and how much the people drink, but few know the exact facts. We are pleased, therefore, to submit the following table of statistics, from the U. S. Agricultural Year Book, showing the consumption of tea, coffee, wines, distilled spirits, and malt liquors, in the United States since 1870, per capita of population:—

Year ending June 30	Tea	Coffee	Wines	Dist. Spirits	Malt Liquors
	Pounds.	Pounds.	Gallons.	Pr'f gal.	Gallons.
1870	1·10	6·00	0·32	2·07	5·31
'71	1·14	7·91	·40	1·62	6·10
'72	1·46	7·28	·41	1·68	6·66
'73	1·53	6·87	·45	1·63	7·21
'74	1·27	6·59	·48	1·51	7·00
'75	1·44	7·08	·45	1·50	6·71
'76	1·35	7·33	·45	1·33	6·83
'77	1·23	6·94	·47	1·28	6·58
'78	1·33	6·24	·47	1·09	6·68
'79	1·21	7·42	·50	1·11	7·05
'80	1·39	8·78	·56	1·27	8·26
'81	1·54	8·25	·47	1·38	8·65
'82	1·47	8·30	·49	1·40	10 03

'95	1·38	9·22	·28	1·12	14·65

—*Dietetic and Hygienic Gazette.*

On the above, a very competent Ceylon writer now in America, writes:—"See how coffee and malt liquor, the drinks of the German and other European elements of population have increased, whereas spirits have fallen off, and Tea makes no progress although price is less than half of what it was 20 years ago."

THE DELGOLLA ESTATE COMPANY, LIMITED.

DIRECTORS:

Wm. Duff Gibbon, Esq., Chairman; Edwin Spencer Fox, Esq.; Frank M. Laurie, Esq.

REPORT OF THE DIRECTORS,

To be submitted to the Annual General Meeting of the Shareholders to be held at the Registered Office of the Company at Kandy, on Wednesday, 21st April, 1897, at 3 p.m.

The Directors have now to submit their report for the year ending 28th February, 1897, together with a statement of accounts showing the results of the Company's work for the past season.

It is recommended that the balance of R5,009·73 shown in the balance sheet be carried forward, and that no dividend be declared. It has been thought advisable to finally close the Organisation Account, and the total amount outstanding R694·66 is now therefore written off.

COCOA.—The heavy and continued rains of the autumn and latter portion of the year had a bad effect upon crop, and as a result there have been secured 409 cwt. out of an estimated yield of 475 cwt. Some of this came into the poor market of last year, but the larger portion is meeting the improved position which has recently been arrived at in the home market, and the last sales showed a very satisfactory result.

On Isabel Estate a good many bearing trees succumbed to the pest so prevalent in this and other districts, but upon Delgolla the loss has not been so heavy.

LIBERIAN COFFEE continues to be disappointing, and only about 25 cwt. were secured. It seems that the fears expressed before are to be fully realized in respect of this product, and that there is but little prospect of benefit from it in the future. Prices also discourage the cultivation.

COCONUTS.—The number of nuts obtained were about 9,550 in excess of the estimate, and 138,050 were secured on an estimate of 128,500 this being some 38,894 in excess of previous year, when 99,156 nuts were gathered. The show of nuts now on the trees in all stages of growth lead the Directors to believe that there will be a considerable increase in the yield of the coming season.

TEA.—In view of the Isabel estate consisting solely of cocoa, it was deemed advisable to plant tea where opportunity served, and this having had the approval of the Shareholders has been done. Some 50 acres have been holed and drained, 45 of which are actually planted with good local jât, and the result so far is satisfactory. The Directors think it advisable that other 50 acres should be taken in hand in the coming season. The planting of tea will very much increase the value of this part of the Company's property.

DIRECTORS.—Mr. Frank M. Laurie retires from the Board in rotation, and being eligible offers himself for re-election.

Mr. E. S. Fox resigns his Directorship, and the appointment of a Director in his place rests with the meeting.

AUDITOR.—The election of Auditor for the ensuing year has also to be made by the meeting.

By order of the Board. J. MUNTON, Agent and Secretary.

MEMORANDUM OF CULTIVATED AREA—APPROXIMATE.

309 acres old cocoa, 25 interspersed with Liberian Coffee, and 140 acres with coconuts.
16 acres Cocoa 6½ years old with Coconuts.
30 acres ,, 4 ,, ,, and Liberian Coffee.
60 ,, ,, 3 ,, ,,
25 ,, Coconuts 5 years old with Liberian Coffee.
102 ,, ,, 60 acres of 7 years and 42 acres of 5 years, with Cocoa planted in 60 acres.
60 ,, Cocoa at Isabel.
75 ,, Grass and old land, of which 45 acres tea

677 acres.

EXPORTS OF COTTONSEED OIL.

The following are the official returns of the exports of cottonseed oil, in gallons, during the month of January, 1896 and 1897, furnished by the Bureau of Statistics, Washington. Total gallons, 1897 2,891,213, 1896 1,156,564.—*Oil Paint and Drug Reporter.*

QUEENSLAND AGRICULTURAL COLLEGE.

We have received a copy of the Prospectus of the Queensland Agricultural College, which is stated to owe its inception to a popular demand for increased energy in developing the latent resources of this semi-tropical dependency—a demand which goes to prove once again the healthy and enterprising state of public opinion which exists in the Southern Colonies and is bound up in the watchword "Advance Australia." The Section of Agriculture in Queensland was created an independent administrative Department in May 1896, with the Hon. A. J. Thynne as Minister in charge. Parliament voted the following sums for the use of the College:—An initial vote of £5,000 for the establishment; another vote of £1,400 for furniture and additions to the building, and £4,000 for salaries, apparatus, tools, stock, &c. The School is purely agricultural. The training, studies, and work of the teachers and pupils are all planned to the end that they may help young men to a knowledge of the methods and reasons of agricultural practice. The course of study, as given in the Prospectus, is as complete as it well can be, and the staff includes about a dozen Instructors. Considering the advanced constitution of the College, the belief of the promoters that it "will play an important part in the improvement of agriculture" in the Colony, is a reasonable one.

In any undertaking,—and particularly in an institution of this nature,—it is most important that there should be no mere temporary makeshift measures, no impediments arising from a grudging of funds, and that ample facilities should be given for allowing the influence of agricultural education to spread freely among those interested. We note that special provisions are made for the carrying out of practical experiments in the field. Such an admirable scheme is what might be expected where there is a qualified head to foster the cause of agricultural education, such as the Queensland Minister of Agriculture. Without the influence of an expert, and where it is left to the mercy of officers with no special qualifications, the cause is doomed to failure. Even in India there are Directors of Land Records and Agriculture, who are highly trained agricultural officers; but in Ceylon, ——well, things are different.

We heartily wish the Queensland College a prosperous career, and that abundant success may crown its laudable efforts to improve the Agriculture of that rich and extensive Colony.

IMPRESSIONS OF A RAMBLE FROM YATIYANTOTA TO NAWALAPITIYA.

April 26.—If impressions of a ramble from Yatiyantota viâ Bulatkohopitiya up through part of Dolosbage on to the Nawalapitiya station is worth inserting, here you are. Leaving Yatiyantota by hackery, a drive of 15 miles or so brings you to Bulatkohopitiya, a small village with bazaars and the ever promiscuous arrack tavern standing on an elevated position inviting Ramasami and Appuhami to wet their whistle ere they tramp on their weary journey. I had a good view of Knavesmire estate which bids fair to rival Yataderia in the no distant future. I passed through Glenalla, that fine property of the Hon. the Legislative Member,—it is a pity though that the cart road goes no further, for I heard very unkind things said of the M.L.C. and his "dog in the manger" policy, twig! Glenalla seems in all probability to have been the *ultima thule* aimed at, on that much agitated question of road extension, to join on the Dolosbage road at Meenagalla. If so I cannot wonder at the anathemas heaped on the Hon.'s head and shoulders. * Going up further, past Waharaka through anything but a road, more like up and down drains, you get to a forest, on both sides of which lies old Damblagolla and Ugieside, looking fine covers of tea. A bit further and Havilland is reached. Here a most elaborate factory is in full swing with a fine show of the latest machinery. This place I remember in coffee when the Bros. Whitham were lords of the show. It never proved an *Eldorado* in the bean (!) like all Dolosbage, but in tea it can hold its own against many estates I know of. There the land is steep but the soil makes up for that. I now hurried on and pushed ahead till I got to Kelvin. Here the tea looks very encouraging: particularly the indigenous tea took my fancy. Originally planted from Horagalla and Seaforth, it has a very even jât throughout. I was told here my nearest way to Nawalapitiya was up through the bungalow facing down the other side to Seaforth, cutting off miles of a rugged road through Kellie Group on to Windsor Forest. Shades of evening made me decide on the nearest way out, so up we went and down a most precipitous hillside short-cut to Seaforth. Here the tea was looking its best, the old seed-bearers being well to the fore. Fearing darkness would overtake me, I had little time to see much, and on we went through some fine patanas, once the flourishing Nagasena. I wonder this estate, which has such a nice lay of land, has not been put into tea. Old Yakdessa forest on the other side looks as if it could make tea sing if only planted on it. Next I passed through Stow Easton, the "Fortune Killer," of the Brothers Hippesley, to think that £7,000 was sunk on this place or the bulk of it seems a dream. The coffee I hear snuffed out in 3 years or so. No wonder it did, there is not a vestige of soil on the two sides of the tavalam road which passes through the place. Some seed tea on very poor washed-out soil I came upon, which did not say much for its capabilities in growing tea. The upper parts which lie under a precipice ought, I think, to do well; but what I saw below will not make its owner fat. Next is Horagalla: here the tea seems growing on freer soil, although indifferent. The seed-bearers I passed through are looking remarkably well, the effects of manuring The young tea shows up pretty fairly well, but not a patch on the teas I came through up to Seaforth. It was now quite 6 o'clock. Weary and worn I pulled my aching limbs or rather dragged them past a vast tract of patana for nearly 4 miles, when to my great relief, I landed on the cart road at Rambukpitiya, a small village bazaar. Judging from the sleek healthy appearance of the Moormen traders I should think this was a very flourishing little hamlet. 3 miles more and I was at the Central Hotel, Nawalapitiya, and oh! with what relish did I not quaff down that bottle of "Pilsener." A change and dinner and into bed till I was woke up with "Sar! I'm ready." 6 a.m.—into the train and off to Kurunegala. Will let you know of that historical feverish country in my next.—C.P.

BRAZIL COFFEE NOTES.

A communication to the *Commercio de S. Paulo* from Campo Alegre says that the coffee crop in that district, which has been a failure for the last three years, promises this year to be "very good," and will repay the planters for the sacrifices which they have made.—*Rio News*, March 9.

* Absurd: the road has always been planned to go right on to the Nawalapitiya one and so it must. —ED. *T.A.*

U. S. COFFEE IMPORTS IN 1896.

The corrected report of the United States Bureau of Statistics makes the total imports, exports, etc., of coffee for the calendar year as follows :—

IMPORTS.

From—	1895. Pounds.	1896. Pounds.
United Kingdom ..	4,205,826	4,865,154
France	1,870,717	1,359 373
Germany	2,739,813	5,584,094
Netherlands	4,033,274	2,986,267
Other Europe	555,590	2,857,892
Central America ..	52,320,272	39,534,589
Mexico	31,961,939	19,641,868
West Indies	18,532,745	8,709,433
Brazil	426,579,035	447,603,789
Other South America ..	73,481,884	74,088,756
East Indies	16,166,002	16,648,642
Other Asia and Oceanica ..	2,228,255	4,408,731
Africa	34,616	102,037
Other countries	2,625,351	1,510,927
Total	642,338,319	629,901,602
Value	$96,512,370	$79,999,590
Import cost per pound (cents)	15.02	12.70
Percentage of Brazil ..	66.4.	71·06
Percentage of Asia and Africa, direct	2.8	3.3

The exports of coffee were 8,187,993 pounds in 1895 and 8,471,938 pounds in 1896, which, deducted from the imports, leaves the net imports, which are reckoned as consumptions, as follows :—

NET IMPORTS OR CONSUMPTION.

1895 (pounds).. 634,150,326 | 1896 (pounds).. 621,429,664

The above shows that consumption did not increase, although it was aided by a decline of 2.32 cents per pound on the average cost of the total imports. Taking the population at 70,000,000, the per capita consumption is 8.95 pounds. The above, on the basis of 131 pounds to the bag, represents an import of 4,743,738 bags, and compares with the Coffee Exchange statistics as follows :—

	Bags.
United States Bureau of Statistics ..	4,743,738
New York Coffee Exchange	4,588,496
Difference	155,242

This is a small difference between the Government statistics and those of the New York Coffee Exchange, in view of the arbitrary reduction into pounds of bags, bales, packages and barrels, varying from 60 to 200 pounds, as is necessary in the Exchange or private compilations. Besides, there are transhipments from one domestic port to another which are liable to be included in the arrivals or imports at both places.

The Coffee Exchange report of imports from Brazil is absolutely correct, and for the year 1896 compares with the Custom House figures as follows :

	Bags.
New York Coffee Exchange	3,416,592
U. S. Bureau of Statistics (131 lb. to bag) ..	3,416,823
Difference	231

This is a mere bagatelle and proves the correctness of both reports of the imports of coffee from a country furnishing over 71 per cent. of the total imports and shipping it in bags of uniform size. There is every reason to have confidence in the statistics of the New York Coffee Exchange.

The following statement shows the movement of coffee in Europe and the United States for 1896, as follows :

	Bags.
Stocks in Europe and United States, Jan. 1st, 1896	1,675,160
Arrivals in United States and Europe ..	11,617,901
Total Supply	13,293,061
Less Stock, Jan. 1st, 1897	1,630,970
Deliveries	11,662,091
Coffee Exchange Report	11,627,881
Difference *	34,210

The above shows the present annual requirements of Europe and the United States to be, in round numbers, 11,650,000 bags. In 1896 the receipts of coffee in Rio and Santos were 7,319,000 bags, equivalent to 62.82 per cent. of the total requirements of Europe and the United States, thus leaving only 37.18 per cent. to be met by Mexico, Central America, other parts of South America than Brazil, Africa and the East Indies.

During the period 1880-89 Brazil furnished 50 per cent. of the world's supply, since which time coffee-planting has so extended as to increase Brazil's contribution 25 per cent. more than it was six years ago. An extension of the industry has also taken place in Mexico, Central America, the United States of Colombia and Venezuela, so that a supply of 5,000,000 to 5,500,000 bags from those countries may reasonably be looked for. Last year all other countries exported to Europe and the United States about 4,000,000 bags.

It is apparent that the world's production of coffee is at present largely ahead of its requirements, and is likely to remain so until prices recede to a point low enough to retard the industry. Nothing but an extensive failure of the crops can prevent coffee ruling on a low basis for some years to come.—*American Grocer*, March 17.

THE COFFEE WAR.

The long-looked-for decision of Judge Morris, of the Court of Common Pleas, has been rendered in favor of the defendants, the Woolson Spice Company of Toledo, O. This suit was brought by T.J. Kuhn and the Arbuckle interest, who claimed that the Woolson Spice Company was selling coffee at a loss against the interests of the minority stockholders, and therefore a perpetual injunction was asked for, and that a receiver be appointed. Judge Morris holds that the matter of the price at which the company may sell its coffee strictly pertains to the internal management of the concern, and so long as they act in good faith the directors cannot be interfered with by the court which cannot restrain a corporation from selling at a low price, even though the minority stockholders can show that sound business discretion would dictate a different policy. The testimony, however, showed that the Woolsons were selling at a fair margin of profit. The application for a perpetual injunction was therefore denied. With regard to the other point, the court holds that the agreement of the majority stockholders to sell the product for a time at such a price as will drive a competitor out of business will not make the corporation an unlawful conspiracy against such competitor, nor liable for his actual loss, nor entitle him to relief in the courts. A competitor for public favor must bow to that law of trade that allows every man to dispose of his own property, in the ordinary course of business, on such terms as he sees fit. The motion for the appointment of a receiver was therefore overruled.—*American Grocer*, March 24.

* Due to variation in European reports.

PLUCKING, PRUNING AND PREPARATION OF TEA.

(Continued from page 776.)

REVIEW OF LETTERS NO. LIII TO NO. LX.

In Letter No. 53, "B.P." from Dimbula enters very fully into the several questions on which information is desiderated—although, in a manner, he ignores the suggestions contained in our circular. He denies that coarser plucking is responsible for the fall in prices, as he believes that more care is taken now to secure good leaf than formerly; and herein he differs from "M.D." who holds that the injurious influence of coarse plucking cannot be gainsaid. This is attested by the Colombo Sales List which disclose sales at eight and nine cents per lb. If coarse or careless plucking is not responsible for such figures, the fault must be in the factory; but it is difficult to see how it can possibly pay to pluck, manufacture, pack and transport teas which fetch such prices, even if we take no count of the bad name they must give Ceylon teas, and the pressure they must cause in an already over-supplied market: and we agree in the drastic proposals of our correspondent in respect of such teas. "Balangoda" is not inclined to hold plucking, pruning or manuring much to blame, but thinks the fall in prices explicable by the larger area of low-grown teas, and the larger quantities which have to be passed through factories which are inadequate and imperfectly equipped. Rush of leaf and insufficient labour aggravate the mischief; and these he holds to be quite sufficient to account for the fall. "G.B.K." from the Central Province does not expressly name coarse plucking: and he is evidently able to find an explanation for the fall in other directions; and the main reason, in his view, is insufficiently equipped factories, both as respects machinery and withering accommodation. He instances case of estates which have, by manuring, increased the yield per acre by 200 to 250 lb., and yet expect the factories which sufficed for the smaller quantity to be equal to the largely increased output. While quite prepared to admit that intelligent supervision is very necessary in the field, he insists that sufficient time is not spent by Superintendents in the factory, and that too much is left in the hands of underpaid native teamakers. If the "boss" on an estate considers factory work a matter of subsidiary importance, and visits the factory seldom, and even then hurriedly, it is not to be wondered if his delegate show no inclination to magnify his office. On the effect of manuring, as on the question of coarse plucking, "M.D." and "B.P." are clearly at issue. The latter feels no doubt that artificial manures, while increasing the quantity, has an evil influence on the quality—though he does not say in what respects and in what manner; but, inasmuch as quality has been affected where there has been no manuring, he refuses to hold manuring alone responsible for deterioration. We are not sure that it would not be more logical to acquit manuring altogether of blame, in the absence of definite evidence of the harm it has done or can do. "M.D." takes this view when he argues that manuring, if only the proper substances be applied, ought to improve quality, reasoning by analogy. The flavour of fruits is known to be improved by scientific culture; if fruits, why not leaf? On the evil effects of severe pruning these two correspondents are agreed—"M. D." declaring it to be a pernicious system, which, however, is fast dying out; while "B. P." characterizes the practice as a fatal error which has done as much to bring down prices, as anything practised outside the factory. On the work of the factory, the two correspondents differ again—the last-mentioned denying less attention to manufacture; while "M.D." feels that there are two many "meets" and distractions to allow of the watchful care so necessary in tea. One thing seems clear to us that no Superintendent, who does not subordinate ease and pleasure to work, who does not do his best for his employer by active personal supervision of both field and factory work, can be said to be earning his salary, or to deserve to advance in his profession. Large rollers too, do not turn out as fine work as the smaller ones of old; and "B.P." holds the proprietor, rather than the Superintendent, responsible for low prices, and sets forth quite a catalogue of delinquencies, in insufficient space and machinery; stinginess in dealing with teamakers; cheap and insufficient management; inability of V.A.'s to give young Superintendents practical lessons in manufacture or to correct their errors; want of encouragement to good Superintendents. Indirectly, he hints that absenteeism is responsible for these blunders; and that an old bush cannot give as good tea as a young bush.

Of the next four letters the one from "W.B.J." of Agrapatana enters most fully into the questions propounded. Like "S." from Rangala, he is not inclined to acquit coarse plucking of responsibility; but he holds that it is chiefly practised in the low-country, as, at higher elevations, the tendency is to pluck even finer than before. On the other hand, "M." from North Matale is silent on plucking, holds over-production the principal offender, has no experience of manuring and acquits pruning and the factory, except when there is a rush of leaf; while "W.A." from Maskeliya expressly denies the evil influence of coarser plucking, as all grades have gone down, and perhaps the finer most. But surely, this is fallacious. We have seen that our best teas have not fallen off in price appreciably, that some maintain their old prices, and some have even advanced; and when the plucking is coarse, can it be said that the finer grades of the break are not also affected? It is gratifying to have from the same correspondent, as a result of a good deal of experience, the opinion that manuring does not affect prices prejudicially, while severe and too frequent pruning does, and is resorted to as a simple method of increasing the yield, without considering the slow replacement of the lost wood; and he instances Kandapola, where tea is allowed to run three years unpruned, with the result that prices are maintained. "W.B.J." goes even further on manuring, and holds that at his elevation it actually improves the quality, if judiciously practised; but he thinks severe pruning less prevalent than it used to be. "S." expects to be able to pronounce more confidently on the influence of manuring on flavour 12 months hence; but want of care and attention has, in his opinion, a great deal to do with poor teas. "W.B.J." shares the latter opinion; and, while admitting that the rapid increase in acreage has increased the number of factories, he doubts the adequacy of the accommodation supplied.

This deficiency, coupled with night work and lack of experience to keep pace with the growing demands for teamakers has had an evil influence; and the remedy should be efficient and close supervision in both field and factory. "W.A.", however, is sceptical about less care being responsible in any way for prices, seeing how much better, and more elaborate is the machinery now used in factories; but may not too much be left to improved appliances by those—only a few, it is to be hoped,—who are inclined to take things easy? "S." evidently thinks this happens in many factories in which the coolies and the teamaker are not adequately supervised. On the whole, "W.B.J." is not inclined to think our present teas, from any well-ordered factory, worse than those of previous years; and accepts the larger profits now, or recently, earned on most estates as evidence that the most profitable system is being pursued. But is that conclusion inevitable? Some planters hold strongly that a reduced output would benefit not only individual estates, but the local tea industry, generally, by inducing keener competition. But each must judge for himself.

(*Letters Continued.*)

No. LXI.

[Some Colombo opinions, from Brokers and Merchants :—]

1. There seems to me no doubt that the coarser plucking in Ceylon has in a great measure been the cause of the gradual decline of the average. Of course, a planter knows what pays him best and he naturally adopts that policy, but it looks almost as if he were killing the goose with the golden egg.

Ceylon used to more than hold its own with India, but now India, with a larger export, has lately had a much higher average, which is due, in a great measure, I understand, to improved quality caused by finer plucking. Nos. 2 to 6 are questions which should be answered by planters themselves, and I do not think that a mere expert on the value of the tea should presume to criticise planting work. LEDGER.

No. LXII.

I am strongly of opinion, and have been so for some time, that the value of our teas is greatly depreciated by want of sufficient attention to preparation in the factory.

The Superintendent of a large estate spends very little of his time in the factory, and the preparation of the tea is left to a native teamaker who simply works by rule of thumb.

This is where India beats us: no Ceylon teas come up to Indians in make and appearance. There European Factory Superintendents are largely employed.

Inadequate factory work will certainly spoil the best leaf that comes into a factory.

MERCHANT.

No. LXIII.

1. I do not think coarser plucking has had much to do with the lower prices.
2. No, certainly not.
3. This not to a large extent.
4. Yes, certainly a great deal is due to this. Everything is left to the *Teamaker*. In old days men employed Kanacapulleys on R15 per month, and bossed him;—50 per cent of the new generation of planters employ teamakers who boss the durai !. Not *fine* plucking, but *careful* plucking such; as is carried out by Mr. Megginson on St. John's; round the estate once in 9 days at outside; and far more attention to the bush for the first six months after pruning, and much more attention to the factory will remedy our poor prices provided we can obtain coolies to do the work. MERCHANT No. II.

No. LXIV.

Coarser plucking undoubtedly has a lot to do with it; but played-out soil and the absence of *manure* is telling on the plants and will continue to do so until more attention is given to it. T.

No. LXV.

Overproduction and higher exchange account for most of it. So long as producers can get remunerative prices for low grades they won't leave off going in for quantity.

No doubt, Indian planters have gone in for finer plucking and they have certain advantages—better soil, better weather for withering and, I think, better withering accommodation. I think Indian tea will always beat Ceylon tea in regard to leaf. W. S.

No. LXVI.

In reply to your questions as to the causes which have brought down the prices for Ceylon teas, my humble opinion is as follows :—

1st. Coarser plucking is not the rule on estates, but quite the exception; greater care is taken in the field the last few years than formerly. When very coarse leaf comes into the factory it will seldom have any bad effect on the best teas as it all comes out in the sifting and is sold as congou and red leaf.

2nd. Manuring old tea and when unpruned, will not have any bad effect on the leaf, but manure applied to pruned trees does undoubtedly give a weaker tea in the cup for several pluckings.

3rd. Pruning.—This is a work that does *not* receive the attention it should. Trees are not *pruned* in our days !—they are cut down. An order is given to cut a field a foot, or 15 inches or 18 inches—the lower and more severe it is cut, the weaker the tea in the cup is for several pluckings. I have seen ten-year old tea cut down 9 inches to a foot. The reason given was: "to get good strong healthy branches"—well it took three years to grow the size the trees were when pruned, the pluckings all that time have been a loss, and the trees have not such good stems as they had previous to the heavy pruning. My humble opinion is that tea, ten years old and over, should never be pruned down below two feet and when pruned that height, every small twig should be cut off carefully and cross branches thinned out &c.,—that is, the tree should be *pruned* and not merely cut down and this can't be done properly under R9 to R10 per acre. Slashing away at the trees the severe way now carried on gives poor leaf till the tree has recovered its branches and foliage.

4th.—Preparation in Factories. There is greater care taken in factories than formerly. In fact sometimes too great a zeal is shewn, and the teas may slightly deteriorate in consequence. What I mean is this: Young Planters are far too ready to be everlastingly tasting their teas, and they will then go to the teamaker, who goes to the cooly rolling and the cooly firing and give *fresh instructions!* This goes on daily in some

factories till the coolies do not know how to act! They do not know for two hours together if they are making proper teas or not. This causes factory-bulked teas to differ much in daily make and therefore in the bulk. If I find a carefully-made tea being made say on the first day of the month, I never bother the rolling or firing cooly. I find they will make the same tea right through the month if *not* interfered with. Coolies in factories are, as a rule, not only very careful if a certain work is given in their charge; but they are also very proud of doing the work. In this way—as I have shewn above—alone do I consider that some bad effect to bring down prices may occur. Teas from some factories that I know, fetched 1s and 1s 3d regularly in the home market a year or two ago and only get 8½d to 9½d now: this has nothing to do with the actual manufacture of those teas; the teas are as good as they ever were. It is the demand for that certain tea that has disappeared.

5th.—Shortness of Labour. The leaf has to be plucked every 8 to 9 days, and if this can be done regularly, the bud and two first leaves with that length of stem is taken, and another full leaf or sometimes half or three-quarter leaf, all make a good tea. Should the estate be short of labour and cannot get over the fields before the shoots get hard and bangy, it makes a most serious difference in the quality of the tea. It is very necessary for good quality tea to have lots of withering room. If withering room could be arranged so that one leaf did not lie on another, and when withered—sharp rolling, and firing, *no fermenting*—we should make better teas.

6th.—The causes for the fall in prices are overproduction, combination amongst buyers, and the ups and downs in the value of the rupee. It is quite evident that the home and local weekly market are always fully supplied with teas. It is quite the usual thing for buyers to go in a half each for a certain grade of tea, and also for buyers to agree that "if you buy the pekoe of that estate, I'll take the other," so there is no high bidding. It might be asked why Indian teas average better than Ceylon teas. It is because London buyers get orders from their constituents to 'send a quality as near as possible to the last lot, our customers like it" and this will go on till one day the shop-keeper can't get the exact tea he wants. So he blends and makes the best he can to suit, and the Indian and Ceylon will very soon be on an equal footing.

7th.—Undoubtedly, the Ceylon Tea Planters keep the pot boiling through Exchange! Take our local sales: the difference between 1s 2d and 1s 3d in the rupee makes a difference of fully 15 cents a lb. in the price we get for our teas,—where shall we be if the rupee stands at 1s 4d —Yours faithfully, OLD DIMBOOLA.

March 6.

LXVII.

Hatton, March 20.

DEAR SIR,—In answer to your circular of 12th Feb. *re* Ceylon tea.

1st. I don't think coarser plucking has been resorted to.

2nd. Manuring with castorcake and bones is a great cause of prices coming down; this is my experience.

3rd. Generally, pruning is lighter than it was formerly.

4th. Less attention in factory may be in some cases.

5th. This is the great evil, short labor force.

6th and 7th, Overproduction and manure not properly applied. S.

LXVIII.

(1) I do not think coarse plucking has anything to do with it as most estates pluck finer or rather more carefully than they did a year or two ago.

(2) Not having manured to any extent I cannot express an opinion.

(3) Yes, I should say in some cases the severe pruning carried out has had a good deal to do with the fall in individual prices.

(4) I think more care is taken now than formerly in preparation.

(5) Not at all, as in my case I have plenty of labour.

(7) I think overproduction is the chief cause. "D."

No. LXIX.

Kandy North, March 3.

DEAR SIR,—Your questions are stiff ones; on that account difficult to answer.

(1) Course plucking has nothing to do with it. The leaf plucked now-a-days is far finer than that plucked in earlier years—say '84 or '85.

(2) Don't think manuring is to blame either. Manuring of tea is not carried on as a rule, on an estate very short of labour. Manure is generally applied in slack months as the harvesting of flush will permit.

(3.) This is a system not much in favor now-a-days—old soils do not grow wood fresh enough for this style of whittling.

(4.) Only teas with quality fetch a price now-a-days; given carefully plucked leaf of this sort; and with usual factory attention, those teas command their price no matter how graded.

Teas which command long prices are not, as a rule, handsome to look at.

Careful supervision is wanted both in field and factory.

(5) Have been fairly well off in this respect, far better off than in days when better prices obtained.

Were the London stock of teas only by millions less, I dont think it would be a bold thing to state that we would soon be on a par again with prices ruling for Assams.—I am, yours faithfully,

"STILL ONE OF THE CREEPERS."

LXX.

March 18.

DEAR SIR,—In reply to your questions as to the causes which have brought down the average price of Ceylon tea, I am of opinion that this may be attributed to,—

1st. Increased supply.

2nd. The falling-off in quality of high-grown teas from the older estates.

3rd. A larger proportion of low and medium grown teas.

Both plucking and manufacture have improved in this district of late years and this is shown by the averages obtained in 1895 as compared with the previous year; the Ceylon average for these two years was stationary, but several places in the Kelani Valley obtained better prices in '95 than in '94. Manuring and heavy pruning have not lowered prices in this district

but have tended, more particularly, with a low jât, to improve the teas.—Yours truly,

A.C.K,

PLUCKING, PRUNING AND PREPARATION OF TEA: REVIEW OF LETTERS NOS. LXI TO LXX.

The first six letters in the previous batch constitute a departure, in some respects, from the character of the sixty letters which preceded them. The earlier replies to our questions were almost without exception from residents on estates. Among the six now under review are several Colombo opinions, from Brokers and Merchants. "Ledger" feels no doubt that coarser plucking explains in great measure the fall in average prices; and while he concedes to the planter the right to decide which system pays him best, he questions whether the goose which lays the golden egg is not being killed by excessive plucking. Ceylon, which had held its own against India, has now to be content with a lower average; while the rest which Indian tea bushes annually enjoy, should ensure them a longer life. "Merchant," on the other hand, is silent on plucking, but holds strongly that the value of our teas is greatly depreciated by want of sufficient attention in the factory. The superintendent of a large estate spends very little of his time in the factory; and the native teamaker simply works by rule of thumb; whereas in India European teamakers are employed, and hence the superiority in make and appearance of the teas produced there. Yet, when Mr. Mitchell and Sir John Grinlinton propounded a scheme for training tea-makers in the Technical School, where scientific and practical instruction might be combined, the Planters' Association rather douched the proposal with cold water; and it was dropped. "Merchant No. 2" does not think coarser plucking has had much to do with lower prices; but he, too, is emphatic against the system which leaves too much to the tea-maker, and contrasts the old *régime* under which the superintendent "bossed" the kanackkapulle, and the present, under which 50 per cent of the *durais* are bossed by the tea-makers. Not fine, but careful, plucking once in nine days at most, attention to the bush for at least six months after pruning, and more care in the factory, are the remedies prescribed. "W S." holds over-production and higher exchange responsible for the fall. That would be a reversal of the bi-metallist theory that gold prices would rise with the rise in exchange; but so long as quantity pays, the system which raises alarm concerning over-production will be followed. Both "W. S." and "Broker" recognise the influence of poor and worn-out soil in regard to which India has the advantage of us, backed up by annual wintering and more favourable climatic conditions. Some of these disadvantages should be sought to be overcome by systematic and intelligent manuring, and "Broker" expresses his belief in the necessity of greater attention to this remedy. "Old Dimbula," in a long and interesting letter, denies either that coarser plucking is the rule, or that when coarse leaf goes into the factory, it can have any bad effect generally on the good teas which are separated in the sifting. But may not the sharp juice and the joint rolling and fermentation tell on the flavour? The theory that manure produces a weaker tea from the pruned bush, and has no injurious effect on the liquor from old unpruned tea, is one that demands investigation, as it is not easy to understand why a bush weakened by pruning should not have tone given to it, and thereby to the leaf, by manuring. It is more easy to assent to the remarks on pruning, which deserve attention—condemning, as they do, the cutting down and hacking, misnamed pruning, which obtain so widely. Judicious pruning should seek to conserve the healthy wood, while removing small twigs and cross branches; and bushes ten years old and over, says our friend, should not be cut below two feet, as the old stems can never be replaced, and it is long before the bush under maltreatment can regain its branches and make a show of healthy flavoury foliage. So far from there being neglect in the factory, greater care than ever is bestowed on preparation. If anything, there is misguided over-zeal which leads to uncalled-for interference with the factory staff, instead of allowing it to work throughout a month, with similar leaf and under identical conditions, in accordance with instructions, which have produced good tea at the beginning of the month. Needless interference and fresh instructions prove puzzling, while they lessen their pride and interest in the work of the tea-maker and his helps. As a rule it is contended, that there is no falling-off in the teas, but the demand for particular manufactures has abated. Shortness of labour does tell on quality by bringing in hard and bangy leaf; and also lack of withering accommodation; but when the market is fully supplied much is made of the slightest deterioration to account for prices which are mainly regulated by the demand.

"S" from Hatton and "A.C.K." deny the prevalence of coarse plucking; while "D" and "Still one of the Creepers" from Kandy North, maintain that coarse plucking has nothing to do with the fall in prices. The last-mentioned acquits manuring, as also heavy pruning, which is getting discredited especially on soils which refuse to grow fresh wood; but he bespeaks more careful supervision in field and factory, and believes that if the stocks in London were less, prices would improve. At present, only teas with quality fetch good prices, however graded, and the highest priced teas are not the handsomest. "A.C.K.," too, holds large supplies as the principal cause of the fall in prices, combined with the larger proportion of low and medium-grown teas which now find their way into the market. The view that the falling-off in quality of high-grown teas from the older estates has had any appreciable effect, is likely, we fancy, to be disputed; but much must depend on the definition of "high grown" and "older estates." Attention is drawn to the higher averages obtained in 1895 over 1894, in proof of improvement in plucking and manufacture; while manuring and heavy pruning have helped, rather than sent down, prices. While "D" refuses to express an opinion on manuring with limited experience, "S" is confident that "manuring with castorcake and bones is a great cause of prices coming down." We should have been glad of the facts and experiences on which this dictum is based, as manuring is now generally considered an essential of cultivation, and the two articles named are in almost universal use, presumably because they have been found helpful to the planter. "S" claims that pruning is lighter than it was, while attention to the factory has fallen

off; "D" holds severe pruning responsible to a great extent for bad prices, and believes that preparation commands greater attention than before. Both agree that overproduction is the chief cause. Altogether, the ten letters under review are not the least suggestive of the series, though they disclose at the same time a remarkable divergence of opinion on most points.

(Letters Continued.)

No. LXXI.

THE INFLUENCE OF TEA SEED IN REFERENCE TO INDIFFERENT TEAS.

20th April.

DEAR SIR,—In view of the discussion you recently started in your columns (and for which we are one and all very thankful to you), *re* fall in tea prices, and the different opinions you elicited as to its various causes which have been voluminously and fully ventilated,—has it ever entered the minds of any of your contributors that *tea seed*, from which estates were planted not long ago, and are still being planted may have a part to play in the output of indifferent teas, wanting in strength and flavor? Common sense speaks for itself. It is an admitted fact that weak, unhealthy, unnourished parents cannot and never could have healthy robust offspring. In like manner tea seed from bushes grown on wasted and worn out estates where other products had held sway for half a generation or more and the soil whereof was originally poor stuff, cannot possibly be expected to maintain healthy seed-bearers and be parents to healthy tea bushes. Where fertilizers can be cheaply applied year after year it may not be so. What about our steep outlying districts where communication is often only a narrow rugged bridle path for miles; these are all at a decided disadvantage. The seed from these seed-bearers must be and will be lacking in stamina, yet seed has been indiscriminately bought and a vast acreage planted. However good a jât may be if the parent trees are on exhausted soil and are poor specimens my humble opinion is that plants raised from such seed will remain tainted with poverty of sap;—manuring might give it a flicker which never can be upto much. The taint of the parents remains embedded: weak and debilitated as years roll by, they will never produce a healthy succulent flush, however nice an appearance the fields may present to the onlooker. At the infancy of tea in Ceylon, say 1880, there were but 3 or 4 places from which seed was procurable. The seed-bearers were about 6 and 7 years old and in their prime, the seed then and for a few years after might have been all that could have been desired and may be so now. I know these places and I was told they have had their seed-bearers planted on virgin soil, what about the worn-out places since sprung up some of them having seed-bearers? "Nous verrons." Every man before buying seed ought to satisfy himself that the seed he gets are not from seed-bearers planted on exhausted and worn-out soil, that is if he has a future to look forward to for producing a rich marketable tea full of strength and flavour. Don't touch seed-bearers on *old* coffee land which never even grew coffee for three years.

By the bye, can you kindly enlighten us as to whether the owner of a paddy-field, after his harvest is reaped, has power to prevent one going over his fields after snipe or say to shoot over his field? Opinions differ—we have decided to make you our referee.

SNIPE.

[Surely, permission of the paddy-field owner has to be got: would "Snipe" allow his native neighbours hunt for hare in his tea-fields without leave asked and obtained?—ED. *T.A.*]

LXXII.

Passara, March 2, 1897.

(1). Of course, rough leaf plucking gives rubbish, but if leaf is plucked medium, and there is room on tats, the tea should be fairly good.

(2). Manuring, I believe, will spoil quality, especially artificial, as the flush comes on so rapidly and is always sappy.

(3). Severe pruning would not spoil quality if the bushes were not plucked so soon, if 10 leaves were left and then *knifed* across, I believe the effects of pruning, so far as quality goes, would be obviated. *I have* proved this.

(4). It is my full belief that *proprietors* err and severely so, in not employing highly-paid Europeans to make their tea, but the well-paid and experienced Manager is required just the same. Men must supervise all works: but no Assistant will remain stewing in a factory on R150. [I believe that this is a great reason why India has gone up; their estates are so large that *they always* have European supervision of best quality making their teas, etc., etc.] Only give them one month in factory and one in field, they are always bright and pert. At the same time if Ceylon proprietors order their managers into the factory and let natives supervise the field,—the results would be still more disastrous.

(5). Men must make up their minds when short of labour to abandon some fields or *only pluck* or rather tip the flush, never minding how many leaves are left; the present method of chasing 14 days' flush has for result rubbish. *First pluck* fully *developed* leaf—small shoots make tasteless tea; (2) have no end of room to lay leaf thin on tats. In wet weather, apply heat—but never until leaf has naturally withered for 10 hours at least; fire low. Employ better paid tea-makers, either *European* or high class natives,—be liberal with tat room. Good teas cost money and are worth it; the present mode of cheese-paring and demand for big crops will not pay. Except in poor jâts, avoid severe pruning, but all this will be no use without a better paid man employed in factory. Managers, at least conscientious men, are given far too much work in field, factory and *office*; they have found this out in *India*, hence their good prices.

R.

No. LXXIII.

Lower Ambagamuwa, March 6th.

1. Coarse plucking is undoubtedly the principal factor in reducing one's prices; but there is just this which some folk lay well to heart "I have quantity and that leaves me a miserable balance on the right ride." *I* question this though! Experience has taught me that quantity when "weighed in the balance is found wanting." Not only are you frantically making efforts to *advertise* your estate, you are further materially helping to reduce the Ceylon average which must sooner or later tell on quantity producers. That coarse plucking has a good 5 per cent. of red leaf is an admitted fact and any percentage of reddish leaf in your break does for you. I have been a sinner but sinneth not now!

2. Manuring tea has always produced good results, a much more sappy leaf has been my experience after the manure has begun to act; I do not think it destroys flavor but this it does: it produces a far richer outturn, a dark black tea full of strength.

3. Pruning: I have always pinned my faith on a medium pruning, but that once in seven or eight years you require to cut down into the white wood is no new discovery; but this does not suggest a hacking down as I have noticed on some places; a judicious low pruning can with very little care be resorted to without injuring your bush, the white wood takes longer to respond to pruning, but when it once does, which is generally about the 3rd month from pruning, your bush presents quite a virgin look; I adopt manuring whilst I have this pruning going on; the flush from these fields is, as a rule, poor in liquor until such time as the new shoots attain the size of your ruling pencil (I do not know how big that is) but an ordinary ruling pencil; it takes a good 5 to 6 months before you have such wood; from thence on to 10 or 12 months it needs no pruning and your flushes are all that can be desired.

4. I am of opinion we are now far more advanced in the preparation of tea than we were 10 years ago when we realized 1s. 6d. average. Even now we can hold our own if more care is paid to the quality of leaf we manufacture. Tea-making begins in the field, so said the great teaman "Cameron."

5. Shortness of labour must and will tell; the only remedy is to cope with a sufficient acreage to keep in touch with your labor force and prune the balance, it is no use trying to haul it all in once in 3 weeks!! I pity the tea you manufacture from such leaf.

C.T.

No. LXXIV.

Kotagala, March 6.

DEAR SIR,—Replying to your questions in the issue of 2nd.

1. Coarse plucking is not sufficiently general to seriously affect the general average.

2. The same remark I think applies to manuring, individual cases might be affected by either treatment temporarily.

3. Severe pruning does affect the quality of the tea adversely for some time.

It is necessary to prune down some time and it is well to let good strong shoots up after this before tipping.

4. A great deal can be done with care and judgment in the factory, at the same time sufficient accommodation and proper arrangements are necessary. It is not so easy handling large quantities of leaf in a single factory, as it is to deal with a reasonable amount—whatever the accommodation may be.

5. The general average may be affected by shortness of labour during April and May, but not I think at other times. Apart from overproduction and increased supply in competition at sales, the soil after a few years seems to have lost something that it formerly possessed. Other things being equal I have noticed the tea from 3 to 5 years old has a point and quality in it that in many cases go off and do not come again. For one thing there is less "bloom." Of course the richer and less exposed to wind and wash the soil is, the longer the tea well be in shewing this falling-off. What is wanted is an expert to experiment on different estates in Ceylon, something in the way Bamber seems to have done in India. He must be a first-class chemist.

W. H. M.

No. LXXV.

Kalutara, March 10.

DEAR SIR,—I find I have omitted to reply to your enquiries of 12th ulto., *re* decline in price of Ceylon teas. The subject is a very big order and I really cannot find the time to treat it as my experience would show me it deserves. Taking your headings, however, as they stand:

(1) Off flat land you cannot in the lowcountry or elsewhere expect much quality in the teas. In such cases I would go for a big yield. On a hilly place I would try and combine quality with quantity. You can't lay down a fixed rule, or generalise from the question you ask.

(2) I don't believe in these light artificial manures, they are "killing the goose," but proprietors expect bigger and bigger yields and we, as managers, are expected to give them.

(3) Pruning, as a rule, is certainly too heavy in the island, but there are many exceptions.

(4) To a certain extent. Men used to do the factory work themselves. Now many take it for granted they had nothing more to learn, and leave too much to tea makers. Yes, you can only make "the best of a bad jât" with badly plucked leaf—but it is equally easy to spoil good leaf by injudicious manipulation in the factory.

(5) Personally on this estate, I can't get the leaf I want, because we are largely dependent on Sinhalese labor, and they hang back unless they can pluck large averages. Thus, when we are shorthanded with Tamils, the Sinhalese will wait until they know they can pluck 30 lb. or 40 lb. off a certain field and then they come and pluck it, resulting in coarse leaf etc., etc. The remedy—is more Tamil labor when we can get it.

To sum up—an exhausting climate on a poor soil, and further exhausting bushes (which have not the rest of a winter as in India) by application of stimulating manures will, I greatly fear, land us in serious difficulties sooner or later. Under its present conditions I am no believer in the continuance of the enterprise and I was one of the earliest engaged in it.

MANAGER.

LXXVI.

High District, March.

DEAR SIR,—1. I don't think coarser plucking has had much to do with it. Some lowcountry Managers brag about their big yields, but they are a small proportion.

2. I have very little experience of manuring, some of my neighbours manure—with prices much the same as before manure was applied.

3. Good tea is never made after severe pruning and the longer the bushes run from pruning the better the tea.

4. Pluckers require a lot of attention, so do teamakers and factory hands: if neglected, prices will fall.

5. Shortness of labour has a lot to answer for. This estate has always been fairly well-supplied with coolies.

6. A much larger acreage now in bearing under 2,000 feet, which, as a rule, gives quantity, and not quality.

7. Too many cricket, tennis, and race meetings: also an oversupply of horses, which must be exercised.

P. A.

LXXVII.

Nawalapitiya, March 15.

DEAR SIR,—I have noted the opinion of some writers that we are plucking now no worse than we were wont to do 6 or 7 years back: this is not so. Some may who can, but there are others who have no other alternative left them and these are in the majority. 7 or 8 years ago we had an ample labour force to cope with our crops, and a gathering in of the harvest every 9th day the rule, not the exception. At present time the exigencies arising from an unavoidable source—a crippled supply of labour with extended cultivation—makes it an almost impossibility to gather in green leaf more than once a fortnight, and when the rush comes on for 3 weeks or more with the inevitable result. This is what makes the plucking coarse. I do not say that we pluck or take off much more than we did—bud 1st and 2nd leaf and ½ 3rd leaf as of yore—but *these* same leaves which come off every 9th day, now come off every 15th, or in some instances every 21st day. Mark the difference of quality from such leaf manufactured! Here is where I come in with the remedy: those estates which cannot cope with all their crop for want of labour must resort to prune down to keep in touch with a 9-day plucking. When this is done, and which ought to be done, the question of over-production and glutting the market with rubbishy teas is practically solved. If we are to place 119,000,000 lb. of tea on the market now,—with a 9-day plucking, we cannot do much more than 104 or 109 million. With this difference flashed across to Mincing Lane, up goes the market. We may put in 120 or even 200 million of rubbish predominating, but with the present labour supply we cannot—decidedly cannot—put in a tea from a 9-day plucking.

Apart from this—factories purchasing leaf from natives! What an amount of injury is being done; in most cases it is left to a native to receive this leaf from Dick, Tom, and Harry, and the results can be better imagined than described. I have seen leaf in purchasing factories. It made me wince to think of our primitive days when we had to depend on manual power to roll our leaf. The quality of leaf I see and saw will no more roll under Ramasami's greasy hands and fingers than a desiccator fire-brick would. Thanks to heavy machinery (if it can be only withered)—the whole tea bush might be transported and rolled into tea, with results of overproduction! And no margin of profit, but a large debit in the no distant future and with it the ruin of a flourishing enterprise. It will be no use to individually try to rectify these evils. All must join hands to save Ceylon's reputation by manufacturing no more muck.

C. T.

LXXVIII.

Pundaluoya, March 19th.

DEAR SIR,—I can only repeat the opinion of the greater number of your correspondents that plucking and manufacture are carried on as carefully today as ever. Manuring is not sufficiently general to have appreciably affected prices. Heavy pruning, doubtless, affects quality for the time; but this has been a factor more or less from the beginning; and the general opinion appears to be that the increased yield more than balances the reduction in quality. However—as I do not manufacture my own teas—I am really scarcely qualified to give an opinion.

There is another question that I should like to see sifted out, viz:—the benefits or otherwise to be derived from the burying of prunings. One of your correspondents ridicules the practice on the ground that a plant could not make use of its own waste products. This might be true (though it is an open question) in the case of leaves, &c., shed naturally after the reabsorption of the sap. But in the case of prunings, the leaves and branches are cut off in their full vigour and must contain a large amount of plant-food capable of reassimilation. And then there is the question of "soil ferments," to which so much attention is now being paid by scientific agriculturists. It has been clearly demonstrated that many substances, while not themselves available as plant-food, may, by their decay, set up fermentation, liberating the so-called "nitrifying organisms" and gases which help to make the inert nitrogen in the soil available for the use of plants. It is at least possible that the fermentation of buried prunings may do good in this way.

We have always heard that lime is prejudicial to the health of the tea plant. Has this been properly tested? It appears from recent papers* on the subject, that "the introduction of lime into the soil . . . . favours in a high degree the evolution and development of the nitrifying ferments" which—in the absence of lime—are hindered by the accumulation of free nitric acid resulting from their action. It seems possible that the bad effects said to have sometimes followed the burying of green prunings may be due to this want of lime.

There is at any rate one very appreciable advantage in the practice—if properly carried out, and that is the check that it gives to insect pests of all kinds. For this purpose it is, of course, essential that the work should be effected as soon after the pruning as possible.—Yours truly,

E.E.G.

[We have heard of a little lime being used with buried prunings with most satisfactory results.—ED. *T.A.*]

LXXIX.

Peradeniya, March 30.

DEAR SIR,—1. I don't think that coarse plucking has much to do with the decrease in prices, but no doubt many estates, which used to go in for fine teas, now make a medium quality.

2. I have no experience of manured tea myself, but the general impression seems to be that manuring is rather inclined to detract from, than improve the quality of the leaf.

3. I don't think the pruning *usually* adopted is so severe as to damage the average quality of Ceylon tea.

4. I think as much care is bestowed on manufacture as ever. No doubt finest leaf can be spoilt by careless withering or manufacture, but, on the other hand it is impossible to make good tea from coarse or uneven leaf—the great secret of making good tea is to have even leaf and a good and even wither.

5. We have never been so short of labour as to affect our work seriously in field or factory

---

* Bulletin of the Botanical Department, Jamaica, Nov. 96, p. 241. "Soil ferment important in Agriculture," by Dr. W. H. Wiley.

and have always had sufficient factory accommodation.

6. Here we have manufactured a similar quality of tea since 1891; and so far as our experience gained in Mincing Lane, goes, our teas are intrinsically the same as ever. I am, therefore, inclined to think that apart from overproduction and similar causes, the only cause that can be given for the average of our teas dropping below that of Indians is a change of taste in the London market. W.

LXXX.

(1) Coarse plucking of leaf has got little to do with it, except in the heavy flushing months.

(2) Manuring with good tillage, in my opinion, improves the quality of the tea.

(3) Severe pruning affects quality adversely for a few months.

(4) I don't think the manufacture gets less attention than it did years ago: good tea cannot be made out of bad leaf, but good leaf may be spoiled by careless manipulation.

(5) Shortness of labour has affected the field work at times, especially in April and May.

(6) Supply, being in excess of demand, is in my opinion the principal cause of the falling-off.

A. C.

LXXXI.

April 3.

DEAR SIR,—It is difficult to say what the exact reason is which has brought down the average price of Ceylon tea, but I have little doubt in the lowcountry coarser plucking has a good deal to do with it, as so many estates find quantity pays better that quality, though in Assam and Darjiling I have never seen finer and more regular plucking than is now carried on in most upcountry Ceylon estates.

(2) The amount of manuring gone in for in Ceylon is not, in my opinion, sufficient to reduce the average of the whole output of Ceylon.

(3) No, severe pruning will, of course, give weak liquored teas for a good many months after the bush has come into plucking; but this wears off the farther away the bush gets from pruning, and it must be remembered that in India, too, severe pruning is gone in for, when the bush requires it, and the same fall has not occurred in Indian prices.

(4) As one of those who hold that the tea is made in the field, I still believe a great deal could be done by the Manager or Superintendent, as he is called in Ceylon, being more in the factory himself and being able to drop in every now and again. At present this is impossible owing to the distance the bungalow very frequently is away from the factory, and the numerous duties, compared to those of an Indian man, he has to perform—field work, factory work, accountant and clerk. In India it is an unheard-of thing for the Manager to be his own clerk, a native writer is kept on a small salary of R15 to R20 per mensem, the Manager's more valuable time and energies being given wholly to his work. The distance the bungalow is very frequently away from the factory at once strikes an Indian planter, where if it was found necessary to build the factory some distance from the bungalow, the latter would at once be removed to within a stone's throw of the factory.

(5) Not at all.—Yours truly,

EX-INDIA PLANTER.

LXXXII.

1. Nothing.
2. Nothing.
3. Nothing.
4. Everything. You bet.
5. About 10 per cent leaf lost.
6. Sport! Sport!! Sport!!!

The above ought to be of more value than all that has been written on the subject because it is undiluted. V. A.

LXXXIII.

April 25.

DEAR SIR,—In reference to the interesting correspondence in your paper *re* tea prices, will you allow me to suggest a solid though unpalatable reason for the recent depreciation of prices:—In former years pure Ceylon tea was extensively advertised and "boomed" in Great Britain; this with the comparatively small supply created a rise of prices above the normal value. Now advertising of Ceylon tea at home seems to have practically ceased and the supply being larger, prices have gone down to their proper level—it is merely a case of supply and demand.

In my experience plucking has been finer, pruning as good, and manufacture more carefully attended to than formerly; still prices have decreased.

Indian teas were not "boomed" by bogus auction sales, etc., as ours were, so they have not had the rapid rise and fall in prices; their better soil, of course, gives them the advantage in the long run.

Can you inform us if the Company for the sale of pure Ceylon tea in packets is still in existence and, if so, how it is prospering?—Yours faithfully, SAHIB.

LXXXIV.

Manuring Tea.—I consider every owner of manure applied to our tea bushes helps to increase the yield, but, the tea plant being unlike coffee, in that, it is a deep feeder, the best way to manure it is to dig a deep narrow hole, say 2½ by 6 ft. as near the tap root as possible, particularly in lowcountry where the bulk of the manure applied to the surface, either by digging or holing, is devoured by white ants who eat up as well every particle of organic matter, as a rule, within 6 inches of the surface. Coffee simply refused to grow in such land, and went out, long before leaf disease appeared in Ceylon, and no wonder when the white ants devoured everything but the tap root, and, in many instances, the very bark of the coffee trees was eaten by them. This accounts therefore, I think, for tea flourishing where coffee refused to grow. Seeing, therefore, that tea has practically no surface feeding roots, would it not be better to apply our manure as near the tap root as possible, particularly at low altitudes?

OLD TEA BUSH.

[This concludes the correspondence in answer to our two circulars and the same will now be published in a separate form for easy reference. —ED. *T.A.*]

PLUCKING, PRUNING AND PREPRATION OF TEA: REVIEW OF LETTERS LXXI TO LXXXIV.

WE have now to deal with the concluding letters of the series, on the important questions which we had placed before our readers, beginning

with the "R." from Passara, while admitting that rough plucking must give rubbish, believes that medium plucking should give good results if only there is withering space; "W.H.M." from Kotagala does not believe that coarse plucking is sufficiently general seriously to affect the general average; "Manager" from Kalutara counsels quantity off flat lands in the low-country, which cannot produce quality, leaving quality and quantity combined for hilly places; while "C.T." from Lower Ambagamuwa reckons coarse plucking as undoubtedly responsible for lower prices, and refuses to believe that the bigger gross yields really compensate for a lower average price. His experience is that coarse plucking gives about 5 per cent. of red leaf, and reddish leaf in a break "does for you." He has ceased to sin after his experience! Of manuring he speaks favourably, as giving a rich strong liquor from the sappy leaf it produces, without injuring flavour; and in this opinion he differs from "R" who condemns manuring, because he thinks it spoils quality, through hastening flush and producing a sappy leaf—which ought to be an object, one should think. "W.H.M." does not believe manuring general enough to affect prices one way or the other; while "Manager" deprecates light artificial manures, as tending to the big crops in which proprietors delight and which he considers equivalent to "killing the goose." Pruning, too, as generally practised, he regards as too heavy; and "W.H.M." agrees with him, as it spoils quality for some time; and they are both supported by "C.T." who pins his faith to medium pruning, but with the reservation that once in seven years the white wood has to be cut into. This, however, is different from the hacking down, which is practised in some places, and which is unreservedly condemned. Low pruning, even when judicious, delays crop, as the white wood takes long to respond; but when it does, say about the third month, the bush presents quite a virgin look. We can quite see that this result is hastened and aided by manuring; and herein "C.T." differs from some of the earlier correspondents who strangely held the tonic responsible for weak liquor. "R." holds that severe pruning would not spoil quality, if the bushes were not plucked too soon; and he has proved that "if 10 leaves were left and then knifed across," quality would not be prejudiced. In the opinion of the last-named, proprietors make a great mistake in not securing well-paid Europeans for the factory. The manager cannot be dispensed with for general oversight, but an assistant will not consent to be stewed in a factory on R150 a month. If the estate be large enough to maintain two assistants, as is the case in India, they might be set to field and factory, turn about, with best results. "C.T." holds that we have advanced greatly in tea preparation during the past 10 years, but more care is necessary in the quality of the leaf that is manufactured; and on that shortness of labour tells. The remedy is to pluck only such acreage as can be comfortably compassed, and to prune the rest. "R." agrees that it is better to abandon some fields than to harvest 14 days' flush, and "Manager" leans to the same view—his experience with Sinhalese being that they hang back, and only come when there is heavy plucking. A larger force of Tamils is necessary to cope with this difficulty. "W.H.M." desiderates care and judgment in the factory, and an expert to inquire into the cause of the deterioration of tea as the bush ages and into the best means of overcoming this drawback. "Manager" holds that the idea that everything that should be known about manufacture has already been learnt, is a serious drawback, and that, if it is true that good tea cannot be made of bad leaf, it is equally true that good leaf can easily be spoilt by injudicious manipulation. He is inclined to take a pessimistic view of the situation, caused by the application of stimulating manures to enfeebled bushes, in an exhausting climate on poor soil; but is not the generalisation hasty? There are bushes in the island 20 years old and more, which seem none the worse for continuous plucking.

"P. A.", from a high district, denies the evil influence of coarse plucking which is resorted to only by a minority in the lowcountry; he has no experience of manuring, but his neighbours who practise manuring maintain old prices; severe pruning affects quality for a time, and therefore plucking should be deferred till the bush has recovered itself; both plucking and manufacture need constant oversight, and neglect of it at once tells on prices; so does shortness of labour; so do too many cricket, tennis and race meetings, and too many horses to exercise; while the growth of lowcountry plantations, which produce quantity, rather than quality, tells on the average. "C.T." returns to the charge [is it the same "C.T."?] with a strong indictment against delayed plucking. The system of plucking may be the same as of old, but there is a difference between flush taken off every ninth day, and leaf plucked every 15th or 21st; and the resulting tea cannot be the same. With deterioration in quality, is accompanied avoidable excess in quantity. The restriction, by one man alone, to plucking only the flush he can properly overtake, will not stay the outturn of muck. United action alone can tell by reducing quantity, and thus helping prices. The mischief is aggravated by the purchase of leaf from natives, whose only object is quantity! "E.E.G," from Pundaluoya holds that plucking and manufacture have the same care now as ever before; that manuring is not sufficiently general to tell appreciably on the average; that heavy pruning, though it tells on quality temporarily, makes up for it by an improved yield. On the burial of prunings he offers some interesting and suggestive remarks which deserve attention, and on which we should like to have the opinion of competent authorities. We have never been in sympathy with those who express distrust of the waste products of a tree as food for that tree, as, in nature, the process of such assimilation must be of constant occurrence; but we can quite understand dead leaves and twigs harbouring fungi and insects which may prove injurious to a shrub, and also the utility of substances which, while guarding against these dangers, would hasten decomposition and otherwise render the plant food more easily assimilable by the bush. That lime can be injurious to plant life is well known, but it is so only in excess, or in special conditions of soil. In a stiff clayey soil, for instance, we do not see how it can be injurious to a tea-plant; and as a matter of fact we know it has been used with the best results in the case of buried prunings.

The last six letters do not suggest many new points, but illustrate rather the diversity of views and the difference in practice which the seventy-seven letters which preceded them exhibited. "V.A." however, arrests attention, alike by his brevity and his decision. Coarser plucking, manuring, severe pruning have had, in

his view, "nothing" to do with the fall in prices; less attention to manufacture "everything." The explanation, thereof, is "Sport! Sport!! Sport!!!" while shortness of labour accounts for the loss of about 10 per cent. leaf. The general verdict would seem to be that, if there could be another reduction of 10 per cent. through the same cause, prices would look up! "V.A." may be thought to prescribe hard measure for superintendents, but there can be little doubt that sport—an excellent tonic in its proper place—absorbs a little too much of the time of some men and boys alike, and that it is a sore temptation to those who have yet to learn self-control, self-denial and the merits of the *via media*. While "W." and "A. C." do not think that coarse plucking has had much to do with sending down prices, an "Ex-India Planter" has little doubt that coarser plucking in the lowcountry has had a great deal to do with it; but in the higher districts the plucking is not to be beaten for fineness and regularity by Assam or Darjiling. Severe pruning is only a temporary drawback, and is practised in India without permanent effects on prices; but the manager should be oftener than he is in the factory, and to enable him to drop in more frequently, his bungalow should be closer to the factory, and he should not be required to be his own clerk. "Sahib" thinks that prices have simply gone down to their proper level, now that Ceylon Tea has ceased to be a novelty in the United Kingdom, and has ceased to be boomed there by special advertisements. "Old Tea Bush" confines himself to the question how best to manure tea, and suggests that it be buried deep as near the tap root as possible, away from the attention of white ants; but do white ants devour all they attack and do they not leave behind a pulverized residuum which is easily taken up by the roots after a shower or two? Here endeth our review of the letters seriatim. We may have a few remarks to offer on them, as a whole, at an early date. Meanwhile we have to thank our numerous correspondents for the readiness with which they responded to our call.

We have already dealt with the series of most interesting and instructive letters, numbering eighty-three in all, on the above subject, as they appeared, in batches of eight to twelve, summarizing their more salient contents and offering such remarks on them as we thought were called for by the circumstances. No single letter, so far as we are aware, escaped our notice. It remains that we should take a general view now of the series as a whole, and indicate some of the chief points which the letters have brought out, or emphasized, in regard to the great industry with which the prosperity of the whole island is so intimately wound up. We do not pretend to offer an exhaustive review, or one which can in any way be regarded as authoritative. We know that among our readers are many men of high attainments, and of far greater special knowledge than we can lay claim to; and we have no doubt that practical planters, as not a few have already acknowledged, have noted the weakness and strength of the Tea Enterprise indicated by the letters under review—so full of knowledge and yet differing so widely, indicating such keen powers of observation and yet acknowledging the need of more light. Still, a few observations from the standpoint of a comparative outsider may not be out of place—especially when they are inspired by hearty sympathy with the enterprise and even a deep personal interest in it.

On the question of Plucking, the general conclusion at which we arrive is that, while shrewd and experienced planters differ, whether coarse plucking is on the increase or not, being chiefly guided in their opinion by the practice of their several districts, there is practical unanimity that the principal cause of the increase of the coarser qualities of teas, is the extension of estates in the lowcountry. The acreage under tea in the lowcountry has been extending much faster than in the hill districts, and as hot steamy places yield quicker and heavier flushes than those at high elevations, there has been a preponderance of teas of the lower qualities as compared with high-grown flavoury teas. Whether that fact supplies a full explanation of the fall in average prices may be doubted. It unquestionably explains the fall to some extent. Among the other causes must be mentioned the undoubted fact that a large number of estates go in for quantity, and the equally undoubted fact that scarcity of labour leads to delayed plucking by which much of the finest flush is lost. The latter fact is not of the planter's own making. Scarcity of labour leads to alternatives—the plucking of fields at longer intervals than one would of choice, and the abandoning of some fields for a season, with the immediate result of estimates running short. It can scarcely be expected that a superintendent would care to incur the latter risk, except under express instructions. It may be as much as his place is worth! Coarse plucking with a view to maintain a high rate of yield is matter of choice; and it has been defended on the ground that it pays. That the system is more remunerative than medium, or even fine, plucking, has been denied; but, clearly, there can be no hard and fast rule, and the plucking which pays best on one estate or in one district need not necessarily be more paying on another. It is useful, however, to remember that 10,000lb. at 6d may really leave less to the proprietor than 9,000lb. at 6½d. Against the gross gain—£6. 5s.—must be set the extra cost or plucking, manufacturing, packing and transport of 1,000lb. of tea which may swallow up the whole of the apparent gain. Apart from that, there is the influence to be reckoned on the market of a diminished output, and of an improved average quality. A reduction in the outturn of 1,000 lb. here and 1,000lb. there, can scarcely affect the general average of prices for the whole island; but the reduction of the total exports by one-tenth, now that they have topped 100 million lb. would mean an appreciable quantity off the market.

The general consensus of opinion is against severe pruning which has been described as hacking, and which, we are glad to learn, finds fewer adherents year by year. It is admitted, however, that at intervals—the longer the interval the better for the bush—there must be a change from light pruning; but experienced planters distinguish between heavy pruning and cutting down or hacking. There is no change in the old belief that the liquor is weak for some time after pruning—the weakness and the duration corresponding to the severity of the pruning. Intimately connected with the influence of pruning is that of manuring, which some writers have stated has the same effect of weakening the liquor. The balance of authority seems to be against this view. Not only so, but also in favour of the opinion that the liquor is strengthened by the greater robustness of the bush which manure induces. This strikes us as the more reasonable view; and our explanation of

the alleged debilitating effect of manuring is that that effect is produced, not by the manure at all, but by its unskilful application, causing injury to the feeding roots. The majority of writers deny any evil effect on the flavour of tea by manuring, and claim that a sappy leaf, which a few planters condemn, produces a strong flavoury liquor. However that may be, there can be no question that manuring increases the crop; that preference is felt for bulky manures, if they can be got, over artificial; and that, although the good sense and habits of observation of our planters have protected them from disastrous blunders, a good deal yet remains to be learnt of the needs of our soils and the constituents of manures, before it can be claimed that our tea-fields are receiving the best treatment possible for crop and for flavour.

We now come to the final question of Preparation. There is no difference of opinion as to the absolute necessity of ample withering space and the general deficiency in regard to it. A good wither is essential to the manufacture of good tea; and most estates or factories are realising this fact, and making adequate provision. On the personal question, opinions seem to be fairly divided—some writers holding that as much care and attention are devoted to manufacture as ever before, while some are very strongly of opinion that the claims of sport are a bar to that earnest, habitual and close oversight of the factory, without which quality gradually deteriorates. Others again think that a more intelligent and better-paid class of tea-makers—preferably Europeans—are called for; but in this climate, continuous work in a heated Factory is not what the European would choose; and we see no reason why local talent should not be rendered equal to all factory needs. Of course, there must be strict and conscientious supervision. On the whole, nothing contained in the interesting correspondence we have dealt with, is calculated to cast doubt on the soundness and the permanency of the Tea Industry of the island, and, so far as we can see, it depends on proprietors and superintendents whether it shall take front rank in the competition with other countries. We should not despise the aid of science; we should not be above attention to the details of work, whether in field or factory; and, provided our labour supply does not fail us, we need be in no fear of over-production or of fluctuating exchange, though these may incommode tea, off and on, as they do all Eastern enterprise and chiefly agricultural enterprises.

PLANTING AND PLANTERS IN THE STRAITS.

NOTES: VISIT BY THE ACTING BRITISH RESIDENT TO THE COAST DISTRICT.

I left Seremban, with Mr. Aldworth, 7-30 a.m., 11th March, for Kuala Sawah by rail. We were met there by Mr. C. M. Cumming. Drove to his new land at Niato and arranged for sites on State land for his cooly lines and house. Visited his nurseries, through which elephants had walked two days before. Drove to Ribu and visited Mr. McClymont's estate thence on to Rantau and breakfasted with Mr. Cumming. Mr. Porcher called for me at1-30 a.m. and drove me or Linsum. We walked over several fields and saw all the estate. At 4 p.m. I started for Pengkaln Kempas, stopped at the Malacca Towkay's tapiocai and pepper estate at the 9th mile Jerak, and, after some conversation with Siew Hin, drove on to Linggi where I passed through some very fine kampongs. Reached Pengkalan Kempas at 6 p.m. and found Messrs. Bowen and Hooper (Contract Surveyor) waiting for me.

March 13th.—At Telok Kemang we got on to the cart road and rode on to Pasir Puteh, reaching Mr. Engler's clearing at 11a.m. He was flying the red ensign in honour of my visit. His house is beautifully situated on a small hill facing the sea which, at this point, forms a bay, and at each end of the bay there is belt of virgin forest standing higher than the intervening land. The shore of the bay is of marvelously white and fine coral sand such as I have only seen in the Cocos Islands. Mr Engler has already planted up 50 acres with an average of 52½ nuts to the acre. His methods of cultivation are very thorough, every particle of superfluous covering to the stem, fronds and nuts of the palm being removed so as to give no harbour to beetles, ants and other insects. The foot of each palm is kept picked and raked, and the result of these operations is apparent in the few old palms near his house which are bearing heavily. He is very anxious to extend his cultivation and I commend his methods to the notice of the Kuala Selangor Company, who would do well to induce him to join their syndicate. At 3 p.m. we rode on and passed through the following holdings of Europeans—viz., Mr. F. A. Swettenham's, the late Mr. Lister's, Messrs. Coates and Tunnicliffe's, Mr. D. C. Neave's, Mr. Watkins', Mr. Douglas's, Mr. Keyser's, Mr. Mc Clymont's, Mrs. Neave's, Messrs. Cumming's, Porcher's, and Bagnall's, the Selangor Sanitarium, the Negri Sambilan Sanitarium, and Mr. Rowland's.

Mr. W. W. Bailey and Mr. C. R. Paterson (a Ceylon tea-planter) drove up while we were thus engaged, and as they were bound for Seremban we all went on together as far as Beranang, seven miles from Semeniyih and 16 from Seremban, where we remained for the night and our visitors went on to Seremban.

THE NATAL TEAS.

(By a Ceylon Planter.)

Mr. John Fraser has sent us through Mr. Gordon Frazer, samples of teas made by him on the Barragreen estate and for which he got the chief prizes at Johannesberg Exhibition. Messrs. A. H. Thompson & Co., Brokers, have courteously furnished the following report on these teas:—

Description.	London Value.	Colombo Equivalent @ Exch. 1/3¼.
Gold Orange Pekoe Leaf Blackish small even well made with tip .. Liquor strong dark good quality.	1/	69
Pekoe Leaf Blackish even well twisted few tips .. Liquor Brisk dark fair strength and quality.	8½-9	46-50
Pekoe Souchong Leaf Blackish well made .. Liquor strong dark little coarse.	7	38

Valuations are quite nominal as we have no quotations for Natal Teas on the market, but judging from the leaf and liquor we think them well worth the above.

The samples can be seen at the *Tropical Agriculturist* Office.

MEETING OF THE CEYLON RHEA FIBRE SYNDICATE.

TO BE WOUND UP.

A meeting of this local Syndicate was held at the office of Mr. E. John at Chatham Street on April 30, when it was decided to go into liquidation. The Syndicate started rhea cultivation on a small scale in the Kurunegala district, where about 12 acres were planted, R3,000 being sunk in the scheme, but there was a lack of confidence in the scheme, therefore the decision to wind up.

BRITISH NORTH BORNEO NOTES.

Telegraph communication with Sandakan has been opened as far as Sinogal beyond Tamoi, on the Kinabatangan, since the early part of March. As Messrs. Applin and Reynolds are on the spot, we may expect very shortly to hear that it is extended considerably. Mr. Reynolds has opened the Eastern Section as far as Imbok.

Rhea has been found growing in abundance at Koyah and a large sample has been asked for to transit to the Court at home. It appears to be *Rhea* (or *Bohmeria*) *nivea*.

Three fine specimens of orchids are on view at Messrs. John Little & Co.'s, says the *Singapore Free Press*. There is a *Dend Phal* var. *Hololeuca* which is said to be worth £50, there being but one other plant in England. An *Angræcum Sesquipedale* from Manila, and a fine *Cyp. Sanderianum* from Sarawak with ten flowers, are also shown by Mr. J. A. Pereira. It is somewhat remarkable that while Central Borneo and Sarawak abound in orchids of great beauty and variety, the species found in North Borneo are comparatively few and insignificant.—*British North Borneo Herald*, April 1.

ECONOMIC CURIOS.

The following are verbatim extracts from notebooks of students in economic botany which were submitted to a well-known lecture as an indication of the progress of his class:—1. "Catechu is used in diarrhœa, likewise to open and clean throats." 2. "Absinthe. It has been proved that a man who uses this liqueur in a great abundance is able to loose his mind soon." 3. "Coffee is pupped (pulped) in a machine." 4. "Liberian coffee was thought that it would withstand the insect ravishes."—*Chemist and Druggist*, April 24.

THE RUBBER FORESTS OF THE HUKONG VALLEY.

The report of Mr. H. N. Thompson, Assistant Conservator of Forests, on the Hukong Valley and Upper Namkong basin, contains much interesting information on the fauna and flora of that region. As Mr. O'Bryen pointed in his report a few years ago on the rubber forests of Upper Burma, the tree in the Hukong Valley is not a gregarious one. Mr. Thompson tells us that it appears scattered generally through the dense evergreen forests, but nowhere does it reach the density per acre of an average teak forest. "Occasionally, a family group of four or five trees may be met with; these are very rare, indeed, and the usual thing is to come across a mature tree every 200 or 300 yards in the richer forests." At the headwaters of the Namkong Chaung the average was not quite one large tree to every two acres. When the tree is surrounded by dense shade, to get to the light it grows to enormous heights, and some of those seen by Mr. Thompson were the largest trees of any species he had ever seen. So exacting is its demand for light that no seedlings were in the soil, but were invariably growing at a great height from the ground on other trees. A few illustrations show the young seedling growing "up the stem of its host, encircling the latter with its aerial roots and sending them downwards towards the ground till they form great supports on which the main trunk of the fig stands; meanwhile the host is gradually killed off and eventually disappears altogether and the rubber tree is left standing on five or six even more thick aerial roots." The *ficus elastica* appears to be able to accommodate itself to many varieties of soil, and apparently grows best at a considerable altitude. Thus, Mr. Thompson records, it grows in abundance on Loimaw hill at an altitude of 5,000 feet, and is reported in various other high altitudes in that region. The Kachins say it does not grow where there is snowfall, but this seems doubtful.

The tract north of the Tanaikha is still the richest in the valley but the difficulties of transport are increasing as the more accessible trees have been worked out. Here a Chinaman Law Lawkha has a practical monopoly of the market. On the spot the price of rubber is two rupees per viss.* A few years ago a trade route was started across the mountains to Myitkyina, but the trader who opened it was murdered, probably, Mr. Thompson thinks, at Law Lawkha's instigation, and the blackmail levied by the Sana Kachins has killed the trade on that route. Some of the rubber around the southern basin of the Tanaikha is supposed to be taken down the Chindwin to Chindat, but this seems doubtful. The natural and shortest route is down the Nampyu to Ra and Palawbum and thence by mules to either Laban or Tingring, and so by boats and mules to Kamaing and Mogaung. With regard to the output of this tract, *i.e.*, from the forests lying at the sources of the Nampyu to the west of Maingkhwan, Mr Thompson says it is very difficult to estimate it. No reliable information can be obtained from either the Singphos or the Chinese traders employed in buying it, as both parties are interested in keeping the real state of affairs dark. Of course the usual cry is that the forest is getting worked out, that they have now to search for indiarubber at great distances from the lines of export, and that consequently the duty levied by us ought to be reduced. The fact, however, still remains that the local Sawbwas have in no way whatever reduced the tax levied by them on rubber collected in their districts or passing through to other places. I questioned four of the most influential Chinamen living at Laban, and who are agents of the large Bhamo and Mandalay firms, as to the out-turn from this portion of the valley during the present season; but their statements were so very conflicting and contradictory that no reliance whatever could be placed in them, and under such circumstances it would be misleading to give any figures......As a single instance of the contradictory statements given by the Kachins, I may say that they informed me repeatedly that the yield of a large unworked indiarubber tree in one season does not exceed ten viss—a very different figure from that usually given, and which of course is too low, as I have personally seen about double that quantity extracted from a large tree." The rubber forests at the headwaters of the Namkong Chaung are rich in rubber. The tree grows in abundance along the banks of the smaller streams and is also frequently met with on the higher slopes of the hills. On these hills Mr. Thompson found the *ficus elastica* attaining as great a height as 200 feet and a girth round the outside of the aerial roots of 100 to 130 feet.

The only forest produce collected in the tracts examined by Mr. Thompson appears to be rubber, and the Kachins from far and near come in to collect it in the dry season. "During my visit to the Upper Namkong and Namsong basins, I twice came across 'octrois' built on the edge of the streams by Singphos from Palawbum and the Amber mines. Toll on all rubber brought down these streams from their headwaters was collected at these stations and none was allowed to pass unless this tax was paid. It was usually taken in kind and amounted to much as ten per cent, the collectors having to pay ten viss for every hundred collected by them. The Singphos from the Hukong Valley must have known that they were poaching in these forests, as they decamped as soon as they heard of my arrival." One local viss, it seems, is equal to one and a half standard viss, so the Chinamen must make a very good thing out of it. The Chinamen of the district are all engaged in the rubber-trade. "Great quantities of rice, silk pasos, gaungbaungs, etc., and stores, are kept by them and sold to the Kachins (at ruinous rates) who pay the price of the goods in indiarubber."

* A viss 3·65 lb.

Every tree in the basins of the Loglai and Taron is known and their positions are pointed out from father to son. It may be taken as correct that the rubber collected in the forests north of the Gedu confluence goes to Assam, while that collected in the forests south of the Gedu goes down the Hukong Valley. All the rubber that goes to Assam is carried by Naga coolies, who can always be had after the crops have been gathered and who are probably more efficient when working in their own country than any other coolies in India. Taronku, the great rubber centre of the tract under notice, is situated at the Taron-Gedu confluence, and the most valuable portion of the forest lies up the Taron river to the Chaukkan pass, along the route traversed some years ago by Colonel Woodthorpe and Major Macgregor At Taronku a fee of Re. 1-8 or three seers of rubber is levied on every man who wishes to cut rubber in the forest. Besides this fee, Mamyung village also collects tribute from the cutters passing through it. Rubber in this tract is getting scarce every year, as the trees are overworked, and it often takes a man no less than forty days to collect a coolie load of rubber. Most of the trees seen by Mr. Way's party had been tapped, and up the Loglai and Turong rivers the trees near the streams are either dead or dying from being overworked Here the Singphos entirely control the Nagas and stand to them, says Mr. Thompson, in very much the same position as a tea-planter and his coolies. Their word is law and is enforced by a very few Singphos over a great number of Nagas. The number of rubber-cutters who leave their villages for the Turong forests is known, and even if they succeeded in evading the impost of the Singpho villages through which they pass, they would inevitably in the long run have to pay up. The rubber when first collected is fairly pure, but the Nagas have learnt from the native bunnias the trick of adulterating it with earth and stones, and so Assam rubber is not looked on with favour by Calcutta brokers. It may be added that the same applies to the rubber that finds its way into the Rangoon market, the Chinamen being adepts in skilfully concealing in the rubber earth and stone, principally the latter.—*Rangoon Gazette.*

TEA PLANTING IN SOUTHERN INDIA.

We continue to get glowing accounts of the region which is being developed for tea in North Travancore by Sir John Muir's Consolidated Company. The exact acreage taken up it is impossible at present to say; but the latest visitor to the spot, so experienced a planter as Mr. R. Morison of Kalutara, declares that his feeling was as if he were looking over Dimbula in forest with a certain number of clearings. The land runs up to a higher elevation than we have in Ceylon; but the bulk is between 4,000 and 6,000 feet; and Mr. Morison is full of admiration of the forest and rich soil. Mr. Milne has got his work cut out for him; but progress is being made and there seems to be no expectation of labour going short. The expectation is that within a few years, 30,000 to 40,000 acres will be planted with tea in this region. Not only planting; but surveys, roadmaking and railway projecting are the order of the day in connection with this big Company's North Travancore land.

COCA AND COCAINE.

Prior to the discovery of cocaine and its wonderful anaesthetic properties, which promoted the development of the export of coca, its consumption was limited to the demand from a few provinces in the neighborhood of mining districts where nothing can be accomplished without it, for, when it fails, the laborers refuse to work. It is therefore an indispensable article for the exploitation of the mines of Peru. Thus we see, that in order to work the mines of Hualgayoc, it is necessary to take there coca cultivated at Cajabamba and Huamalcucho, situated on the banks of the Maranon River.

Twenty years ago the culture of coca was limited to the localities most favored by the climate and the low price of labor. In the province of Otuzco it was cultivated on a large scale, only on the farms of Choquisongo and Saniamas, which supplied the local consumption and that of the mining districts of Salpo and Sayapullo. But an important change has since taken place in that province, which is, today, the greatest producer in the north of Peru, exceeding Huamacho and Cajahamba combined, in quantity and quality, notwithstanding the fact that most of the trees are young and do not yield a full crop; that is to say, they do not produce as yet a quintal per thousand plants, as is the case with those over six years old. This quantity is the average of the crop per year.

The following table shows the actual and approximate production of the province of Otuzco and the number of plants:—

Localities.	No. of Plants.	Annual Crop. Quintals.
Choquinsongo ..	200,000	360
Huayobamba ..	600,000	800
Cayancsal and Saniumas ..	150,000	400
El Rajon ..	100,000	240
Llagueda ..	50,000	100
Sacamaca ..	300,000	300
Las Pampas and Callancas	600,000	1,000
Compin and Anexes ..	600,000	1,400
Chuquillanqui ..	100.000	100
Total	2,700,000	4,700

It will be seen by these figures that the total annual production amounts to 4,700 quintals (about 200,000 pounds), which, in a few years hence, when the plants are fully developed, will reach between ten and twelve thousand quintals.

There are two firms in Trujillo, who purchase coca for the manufactories of Lima; but, as they have the monopoly, being the only wholesale purchasers at auction, they put up or lower the price as they please; and as the firms in Lima pay 30 soles per quintal, delivered on board at Salaverry, they make a very profitable transaction. Mr. Genaro Risco, owner of a farm at Huayobamba, and Mr. Jose Antonio Delfin, at Cayanchal, intend to establish a manufactory of cocaine on their property, so as to be independent of that intolerable and ruinous monopoly, and inaugurate a wholesome trade competition.

In the Review El Tiempo the current price of cocaine in Lima is quoted at 60 centavos per gram; and as a quintal of coca yields from 8 to 12 ounces, according to locality and quality, it results that a quintal of coca leaves, costing between 15 and 20 soles, produces 181 soles' worth of cocaine; from that amount must be deducted the price of reactives; kerosene, cautic soda, sulphuric acid, carbonate of soda the cost of labor; but which still gives a handsome profit. The wages vary from 20 to 30 centavos, two meals, and a ration of coca per day. In some places, like Huayobamba and Sacamaca, the culture is done on shares, the laborers receiving half of the crop and delivering the coca dried and in bales. Excepting the farms at Chuquillanqui, situated on the banks of the river of that name, all the others are near the Usquil River, which joining the former at the foot of Huancay, form the Chicama River.

The best condition for the successful culture of coca is a temperature not lower than 21 degrees and not higher than 30 degrees. In regard to the altitude best adapted for its development, the farms of Callancas, Huayobamba, etc., are generally at a height of 3 000 or 4,000 feet above sea level; there are a few, however, at 5,000 feet, but their products are inferior. Those of Chuquillanqui and some others are at 2,000 feet.

The quality varies; the coca grown in a dry soil is better than that cultivated in damp localities, like that from Chuquillanqui, which, although reaching three or four feet in height, has not the same strength and properties as that from Callancas and Huayobamba. There are about eighty small coca planters in Las Pampas and Callancas; over one hundred in Compin, and scarcely twenty in Chuquillanqui; it is but a few years ago that the cultivation of the plant has been introduced in those places, and therefore too recently for its full development.—El Comercia, La Paz.—*Oil Paint and Drug Reporter.*

COCONUT OIL.

THIS, the staple oil of the Colony, is in very small demand at present, and no sales can be made locally beyond what will satisfy a somewhat limited demand from India, the Straits and China.

The present depression is mainly, if not entirely, brought about by exceptionally abundant supplies of tallow in Europe and America—the chief competition with coconut oil in the manufacture of soap, candles &c., and the outlook is anything but reassuring to holders of coconut oil.

The stock of tallow in London under last advices was 52,211 casks, against 45,716 and 20,650 casks respectively at same period of 1896 and 1895. Spot prices in London of coconut oil and tallow in April of 1895-7 were:

1895	Ceylon Coconut Oil	£23- 5
1896	do	22-15
1897	do	22- 0
1895	Tallow (good mutton)	23- 0
1896	do	19-15
1897	do	19- 5

It will be noticed at once that while the price for tallow has receded £3-15 per ton, Ceylon coconut oil only shews a decline of £1-5 per ton. This is mainly due to exceptionally small stocks of coconut oil being held in London of late years, not exceeding on a average 600 tons, and if any important quantity was shipped to the United Kingdom, prices would in all likely hood run down almost to a par with those for tallow. As we go to press telegraphic advices quote coconut oil on spot nominal £21-10, no sales and prices tending downwards. Only once within the last ten years has the spot price of coconut oil in London been lower than it is at present, this was in October 1892 when the price was £21-5.

Our exports of coconut-oil (taken from Ceylon Chamber of Commerce returns) to India the Straits and China were:

6,260 tons	in	1896
1,859	,,	1895
1,407	,,	1894
7,663	,,	1893

against exports to Europe and America of

10,650 tons	in	1896
16,740	,,	1895
22,809	,,	1894
11,747	,,	1893

The Eastern markets (especially Calcutta) are very important ones as the foregoing figures show; yet it is to Europe and America that we must still look for the chief offtake of coconut oil, and so long as competing products, such as tallow and palm oil, are in abundant supply there, so long, we fear, must we look for a weak market and low prices on this side.

It is true that the manufacture of desiccated coconut is increasing steadily, and it may be noted that the exports for 1896 are 2,000,000 lb. in excess of these for 1894, but the consumption of coconuts which this increase represents, is not of sufficient importance to tell on the market for copra when oil is depressed in the main consuming countries through successful competition of other oils and greases. So far as we can see relief is not likely to be forthcoming in the near future, if tallow continues to flow into the consuming markets in such qualities as to prevent any appreciable diminution of stocks. Growers of coconuts must therefore, we fear, be prepared to receive on the average lower prices in 1897 than they have been accustomed to receive in recent years.

BULKING OF TEA.

(*From Our London Letter.*)

LONDON, April 9.

THE CEYLON ASSOCIATION IN LONDON AND THE INDIAN TEA ASSOCIATION (LONDON)

have this week been called upon once more to deal with complaints of the indifferent

BULKING OF TEA

offered for public sale—in many instances the entire absence of bulking. The loudest complaint came to the Ceylon and Indian Associations through the London Tea Brokers' Association from the London Wholesale Tea Dealers. The Committee of the Tea Dealers' Association passed a resolution which stated that the requirements of the clause in the public sale conditions which declared that "these teas have been inspected, and bulked (if necessary)" had not been carried out in a great many cases. The Committee added that they must insist on this condition being faithfully observed, and that in the event of any parcel not having been bulked in the Indian Warehouse a statement to the effect that it had been bulked in India and Ceylon, and inspected in London, should be inserted in the catalogue. The Tea Brokers' Association sent this resolution on to the Ceylon Association in London, and the Indian Association. Mr. W. G. Price, the Secretary to the Tea Brokers, also received a letter on the subject from Messrs. J. Tetley and Company, who stated that they had had many complaints of great irregularity in the bulking of Ceylon tea, and quoted from a letter written by one of their agents which said that irregularities had been of "such frequent occurrence as to call for imperative action on the part of the wholesale trade." "Nothing," the letter went on to say, "can be more destructive of confidence in the merchant, or create a greater feeling of insecurity in the mind of the buyer, than a false sample—which, in plain English, is what careless or neglected bulking amounts to." Mr. T. J. Lipton goes farther than this, for he has circularised the buying-over workers, vowing that he will, in future, decline to look at any "bought-overs" unless the teas are guaranteed as having been bulked in London, and asking that no samples shall be submitted of teas that are not thus guaranteed.

A meeting of the Tea and Produce Committee of the Ceylon Association was held on Monday to consider the matter, the members present being Messrs. J. Hamilton, W. Herbert Anderson, W. J. Thompson, T. Stretch, F. H. M. Corbet, A. L. Hutchison, J. L. Shand, W. M. Leake, G. White, A. Brooke, A. G. Stanton, S. J. Wilson and C. J. Scott. It was decided "to invite the

attention of importers of Ceylon tea to the imperative necessity for complying with the conditions of the clause referred to, so that buyers may operate with the fullest confidence in the future." The Committee pointed out that inasmuch as careless or neglected bulking of necessity involves unreliable samples, the complaint is undoubtedly a serious one; and they regretted to find on inquiry that the complaint was not altogether unfounded. The Committee of the Indian Tea Association have called the attention of importers of Indian tea to the matter.

Before this letter reaches you, Messrs. Gow, Wilson & Stanton's work on the

TEA PRODUCING COMPANIES OF INDIA AND CEYLON

will be in your possession. I had a talk with Mr. Wilson today about the book, further supplies of which are being loudly called for from the publishers. Mr. Wilson tells me that the main object of the book—which is to bring to the notice of the public the fact that there is a very large field for investment of capital in the tea-producing industry—seems likely to be attained, judging by the large amount of notice it has attracted in the London and provincial newspapers. Lengthy notices have appeared in the *Manchester Guardian*, the *Newcastle Daily Chronicle*, the *Statist*, the *Dundee Advertiser*, the *Scotsman*, the London *Telegraph* and the *Money Market Review*, and shorter notices in scores of other papers in all parts of the country. This bold advertisement of the British-grown-tea enterprise must do good. The *Economist*, in the course of a very friendly review, remark that the authors do not offer any opinion as to the extent to which the new areas steadily being brought into cultivation both in India and Ceylon are likely to affect the relations of supply and demand. In its leading article last Saturday the *Financial Times* names the compilation "The Tea 'Burdett'" and deals at great length with the tea industry from the investor's point of view. Speaking from this point of view Messrs. Gow, Wilson & Stanton mention several features shown by tea companies as being especially satisfactory. The statement of this side of the case, says the *Financial Times*, is undoubtedly correct as regards by far the greater numbers of these companies, though an exception could be pointed out here and there. It may be objected against the book that it only brings the history of the large majority of the companies up to the end of 1895, but it was impossible to do more than this, except in one or two cases, since the reports of most of them for 1896 will not be issued until May or July next. For last year the consumption of Ceylon tea is given at 80,294,000 lb., or 35 per cent of the total. All this, says the *Financial Times*, is very re-assuring for holders of India and Ceylon producing companies' shares; and almost equally so is the increase in consumption of tea per head of the population. In fact, we have almost as good a right now to be called a nation of tea-drinkers as we have to be called a nation of beer-drinkers.

THE ACME TEA CHEST COMPANY are likely to send out their Assistant Manager, Mr. H. J. Stewart Brown, to exploit Ceylon. The Acme is taking wonderfully in India and is becoming a big industry as may be seen from the extract given elsewhere entitled "New Industry for Glasgow."

TEA BULKING.

A recent mail brings us news of a great outcry from the Associated Wholesale Tea-dealers in London against the carelessness displayed in respect of the bulking of Ceylon tea offered at public sale. The Tea and Produce Committee of the Ceylon Association in London have met to investigate the charge, and have practically entered a plea of "Guilty" on behalf of their clients - or at any rate of some of them. Of course, neglect of bulking is a very serious matter, as everybody is aware who knows anything of the method of operations in the tea trade. Bulking in London is a very costly thing, and though only an unscrupulous importer would, to save charges, deliberately violate established conditions of sale, it has come out in the inquiry made by the Ceylon Association Committee that there is sometimes a certain looseness of statement as to whether parcels of tea have really gone through the bulking process before leaving Ceylon. The long-suffering wholesalers do well to be angry when they come across more than a stray instance or two in which sample and bulk seem to be almost entire strangers to one another; but they cannot complain of the spirit in which they have been met by the Ceylon Association (and by the Indian Association, for Indian tea was complained of, too). No doubt the representations of the Association will receive due consideration in the proper quarter.

THE PANAWAL TEA COMPANY, LIMITED.

Report of the Directors of the Panawal Tea Company, Limited, to be presented to the Shareholders at the Fifth Annual Ordinary General Meeting, to be held on Friday, 23rd April, 1897, at the Office of the Company, 39, Victoria Street, Westminster, S. W., at 3 o'clock in the afternoon.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending December 31st, 1896, duly audited :—

	£ s. d.	£ s. d.
The net amount at credit of profit and loss account, including balance brought forward at 31st December, 1895, after providing for General Expenses, Directors' and Auditors' Fees.		2,035 12 11
An interim Dividend of 4 per cent. on the Ordinary Shares for the half-year ending 30th June, was paid 3rd October, 1896, amounting to.......	680 0 0	
It is proposed to pay a final Dividend on the Ordinary Shares from 1st July to 31st December, 1896, at the rate of 4 per cent. (making a distribution for the year of 8 per cent. free of Income Tax), which will absorb...............	680 0 0	
Dividends on the 7 per cent. Cumulative Preference Shares were paid for 1896 in full, amounting to.............	371 0 0	
It is proposed to write off part of the cost of New Extensions, Machinery, &c.. completed during the year...........	213 17 7	
Leaving to be carried forward to next year a balance of.......	90 15 4	
	£2,035 12 11	£2,035 12 11

The Directors recommend the distribution of a dividend at the rate of 4 per cent. on the Ordinary Shares of the Company from 1st July to 31st December, 1896, making, with the Interim dividend paid to 30th June,

1896, a distribution at the rate of 8 per cent. for the year.

The acreage of the Company's properties on 31st December last was:—

Tea in full bearing	.. ..	510
Do. in partial bearing..	..	67½
Do. under two years old	..	100½
Do. do. one year old	..	16
Jungle	..	363½
		1,057½

The Directors consider the result of the year's working to be on the whole favourable, having regard to the serious rise in exchange and the somewhat lower price realised for the Company's tea during the year. The loss occasioned by the rise in exchange during the year represents over 2 per cent. on the Ordinary Share Capital of the Company. The fall in prices and the deficit in the yield, as compared with the estimated crop, may be attributed to the abnormal rainfall, which was 50 inches over the average. The crop realised for 1896 was 279,191 lb., as against an estimate of 290,000 and a yield of 260,352 lb.. in 1895. The cost of tea f.o.b. Colombo was 23¼ cents per lb. The new central factory is now approaching completion, and it is hoped that when in working order it will effect an improvement in the quality of the tea and a reduction in the cost of manufacture. The Interests Deposits stand in the Balance Sheet at £1,520. These deposits the Company is in a position to pay off out of part of the profits realized on the recent sale of the Rangegama Estate, and they have accordingly given notice to do so on or before the 30th June next.

HILL TRAMWAYS FOR ESTATES IN CEYLON.

If any further evidence were required of the unreliableness of the Report so hastily compiled by the so-called Hill Tramways Commission, it is afforded in the proceedings at a recent meeting of the Udapussellawa Planters' Association. If there was one line more than another which might be deemed ripe for report, owing to previous prolonged investigation, it is that of the proposed Nanuoya-Nuwara-Eliya-Kandapola Tramway. The Commissioners must have had all the information collected by their predecessors before them; and yet if Messrs. E. E. Nicol and E. J. Brown are to be relied on—and their Resolution on the subject was carried unanimously—a very large portion of the traffic of the districts was omitted altogether from the Estimates adopted by the Commission! This is scarcely credible—and we have not time as we write to verify the charge propounded by the Udapussellawa planters; but if it holds good, of course the Commission's Report falls to the ground as worthless; while if our Udapussellawa friends should be mistaken, it would, at least, show a great want of clearness in compilation when such an almost unprecedented charge could be formulated. The planters allege that all the Nuwara Eliya traffic is omitted and also the traffic of the Nuwara Eliya and Kandapola estates! If this can really be demonstrated, it must prove fatal to the Commission's Report which had then better be laid on one side for correction and revision generally.

Revision is the more necessary; because it is evident that several other districts have had less than justice done to them. We ourselves hold the Commissioners to be too hasty in condemning offhand the Peradeniya-Deltota-Hewaheta Tramway. If laid on the existing road as far, at any rate, as a central point like Deltota itself, it should show a remunerative margin. Now, again we have the report of proceedings held by residents in the Northern Districts meeting at Teldeniya and they make out a very fair *prima facie* case for reconsideration, although the Commission was in too great a hurry to wait for their information. Delay in this case is accounted for by the scattered nature of the districts concerned. This Northern or North-Eastern road tramway is, perhaps, one of the most promising yet propounded; and altogether, we trust the Governor will see his way in due season, to reopen the Enquiry and afford an opportunity for a more careful and correct Report on the subject of Hill Tramways.

A TEA COMPANY AMALGAMATION.

We observe that meetings of shoreholders of the Nedeem, Kumai, Chengmari, Baintbari and Toorsa Tea Companies have been convened for the 15th instant with a view to sanctioning their transfer to a London Company to be formed with a capital of £400,000, of which only £360,000 will, in the first instance, be called up. The capital of this Company will be divided into two-thirds 5 per cent. cumulative preference and one-third ordinary shares.

The properties to be taken up are:—

	Total area.	Area under plant.	Price. £
Nedeem ..	3,781	2,018	245,000
Chengmari ..	6,188	1,432	9 ,000
Kumai ..	2,089	656	36,000
Baintbari ..	910	383	12,000
Dalgaon ..	2,200	1,001	30,000
Toorsa ..	8,288	535	25,000
	23,456	6,025	338,000
Working capital ..		..	22,000
			£360,000

In addition to the 6,025 acres under cultivation, a further extension of 1,025 acres is contemplated in 1897, and it is estimated that a further 5,000 acres are available for planting. The price to be paid works out £56 per acre under tea. The profits from the Nedeem, Chengmari, Kumai and Baintbari Companies for the last three years have been:—

	R
1894	298,011
1895	234,278
1896	271,937

which have been divided in dividends and applied to extensions. The Nedeem Company has paid a dividend of 20 per cent some years past, and is considered one of the finest gardens in the Dooars. Taking exchange at 1s 3d. the amount required to pay the preference dividend on the new company will be R192,000 so that it will be seen that these shares are amply secured. The amount to be paid for each garden works out per share about as under:—

	R
Nedeem	390
Chengmari	310
Kumai	313
Baintbari	120

These figures compare favourably with present prices here. The new Company will be called the Nedeem Tea Company and should be a most successful one. Amalgamation, such as these, are steps in the right direction in the tea industry. The reserve capital of £40,000 is intended to be applied to developing the Dalgaon and Toorsa concerns. The present shareholders will have the right of retaining one-third of their interest if they desire to do so—*Capital.*

BRITISH NORTH BORNEO.

A special meeting of members of the London Chamber of Commerce was held on 7th inst. at Botolph House, when Mr. W. B. Pryer, formerly senior resident, British North Borneo Company's service, and recently manager of the North Borneo Development Company, delivered an address on "Prospects of Commercial Development and Planting in British North Borneo." Mr. James Chambers (vice-president of the Chamber) took the chair.

Mr. Pryer, having described the geographical features of the island and climate, particularly in its northern part, said that, owing to immigration of different nationalities, there could be no doubt that the population would be a very mixed and confusing one, but also without much doubt that the Hakkas from South China would form the main bulk of it. Sandakan Bay claimed to be one of the finest harbours in the world, rivalling Rio and Sydney; several rivers, creeks and waterways ran into it, giving access to a large area of fertile land. As the rivers which ran to the north and south of Sandakan all had bars at their mouths, their trade and produce had to be carried in shallow draught steamers, and transhipped at Sandakan, which, therefore, had a large future before it. Forest produce included indiarubber, guttapercha, birds'-nests, beeswax, camphor, dammar, rattans and timber. Indiarubber, guttapercha and rattans had been largely exterminated in many of the districts where once they were abundant, so that now there was even difficulty in getting seeds for their proper cultivation, which was to be regretted, as, if planted and looked after in a proper way, they were an extremely remunerative and very inexpensive crop to raise. Every dollar invested in doing this a few years ago would have been worth twenty now. Timber was more likely to attract the attention of capitalists. The greater part of North Borneo was virgin forest, and it has been calculated that the amount of good timber per acre averaged about 200 tons. The best kind was known as billian or ironwood, which was in considerable request in China for piles and beams, whilst it was said to be unsurpassed for railway sleepers, and there was likely to be a huge demand for it when railway making commenced in China in earnest. In the south-east part of the country there were very extensive coal fields, and outcrops of coal occurred in several other places right across to Sandakan Bay. Gold existed over a considerable area up the Segama River and inland from Darval Bay, but, so far, the quantity obtained had been small. Diamonds and other precious stones had been found two or three times in different parts of the territory, as well as specimens of cinnabar, copper, antimony, arsenical silver, and other metals. A hill of mica had been discovered up the Labuk, and it was impossible to say what the real mineral wealth of the country was until its centre part had been more thoroughly explored. Indications of petroleum oil occurred in two or three places, and exploring rights had recently been granted. Should oil be found it would give a tremendous fillip to the country. It had been said by people who knew the country and its resources best that North Borneo was the least crowded and most promising of any British possession that now offered a field for the employment of British youth and British capital, and it was without question in its soil that the future prosperity of the country and of all connected with it chiefly laid. As many of the country's products specially lent themselves to manufacture, they would, no doubt, soon see springing up, in the most advantageous positions, sugar-mills, coconut and cottonseed oil mills, cotton ginning works, additional sawmills, paper-making works, fruit canning works, and many others. There was no reason why North Borneo should not have as many people to the square mile as Java, with its 22,000,000 inhabitants. To show what could be done, he mentioned an estate twelve miles north of Sandakan, started five years ago, where there was at that time nothing but virgin forest. Today there were over 1,000 people there, some of them getting their livelihood from wages, others cultivating the soil on their own account, while over a space of some 1,500 acres the forest trees had been replaced by valuable produce-yielding plants. What had been done on the 1,500 acres could be done, and would be done, sooner or later, on an indefinite number of similar areas in the country. In time Borneo would be the chief supplier of cotton to China and Japan and of sugar to the Hongkong refineries; would supplant the Philippines as the chief producers of Manila hemp; run Singapore hard in the export of copra, sago, tapioca, and gambier, and he also hoped that North Borneo would be one of the main contributors to the world's supply of indiarubber. The cultivation of these articles offered, as far as human foresight could go, the safest and best of investments. The main need in connection with the country, it seemed to him, was actual proof that such was the case, and when it was made clear from actual demonstration that coffee, copra, land and other things, under proper management, were almost as safe as Consols, and out and away more remunerative, there would be no lack of capital forthcoming.

A discussion took place on Mr. Pryer's interesting paper, and the meeting closed with a vote of thanks for the same.—*L. & C. Express*, April 9.

"HARD TIMES AND DRINK."

Under this heading, the American *Grocer* of March 24th has the following interesting review:—

COFFEE.

Measured by the number of gallons of the beverage consumed, coffee ranks next to beer as a popular beverage. The net importations for ten years and per capita consumption has been as follows:—

Year.	Pounds.	Av. import cost—cents	₱ capita. Pounds.
1887	500,819,587	10·7	8·53
1888	408,562,775	14·0	6.81
1889	561,132,100	13·0	9·16
1890	490,161,900	16 0	7.83
1891	511,011,459	*19·0	7 99
1892	629,671,748	*20·0	9.61
1893	551,395.250	14.0	8·24
8894	517,068,994	16·4	8·01
1895	643,234,766	14·7	9·22
1196	572,671,840	14·6	8·04

* Overvalued by reason of depreciation of Brazilian paper currency.

All coffee is imported in the raw bean, and on the average loss 16 per cent in roasting, and allowing for which leaves a net consumption in 1896 of 481,044,346 pounds. The Import cost was $83,534,366, or 14·6 per pound. Coffee retailed in 1896 from 20 to 36 cents per pound, and averaged about 25 cents. Assuming that one pound of coffee makes two gallons of infusion, we have a year's consumption of 962,088,692 gallons at a cost of $120,261,086.

TEA.

The per capita consumption of tea does not increase; in fact, is less than it was twenty-five years ago, when it averaged one and one-half pounds, against one and three-tenths pounds in 1896. The net imports, assumed to represent consumption have for ten years past been as follows:—

Year.	Net imports. Pounds.	Av. import cost, ₱ lb. cents.	Consump'n ₱ capita Pounds.
1887	87,481,186	18.7	1.49
1888	83,944,517	15.8	1.40
1889	79,192,253	16.0	1.29
1890	83,494,956	15.0	1.33
1891	82,395,924	17.0	1.29
1892	89,610,741	16.0	1.37
1893	88,131,088	16.0	1.32
1894	91,801,565	15.1	1.34
1895	96,437,042	13.5	1.38
1896	93,340,248	13.5	1.31

The import cost of the tea received in 1896 was $15,585,741. The retail cost was at least double this or $31,171,482. Ranhofer, *chef* at Delmonico's, uses four gallons of water to one pound of black, and three gallons to one pound of green tea. Others estimate 200 cups to the pound, and some only 100. India and Ceylon tea will make fully 50 per cent. more of infusion than can be made from the best China and Japan sorts; in fact, sixteen gallons of proper strength are made from one pound of leaf. It is safe to say that one pound of tea as ordinarily brewed will make five gallons of beverage, on which basis there was last year a total consumption of 466,701,240 gallons, costing 6 3-5 cents per gallon, thus making tea the cheapest of all beverages in general use. If machine-made (Ceylon or India) tea is used, a gallon of good tea will cost the consumer from 3 to 5 cents per gallon.

COCOA, CHOCOLATE, ETC.

The 1896 imports of crude cocoa, leaves and shells, amounted to 23,276,597 pounds, valued at $2,387.078, Of manufactured cocoa there were 1,244,309 pounds imported,valued at $410,249, or a total import of cocoa and preparations valued at $2,797,327, deducting from which $166,415 worth re-exported, we have as the import cost of the cocoa imported $2,630,912. A large part of this is used for confectionary and other purposes than a beverage, but it is safe to estimate that the retail cost of the chocolate and cocoa used as a beverage does not exceed $3,000,000.

THE TOTAL DRINK BILL.

Bringing together into one group, we find that the United States consumed in 1896, alcoholic and non-alcoholic stimulants to the value of $1,016,126,400 as follows:—

	Dollers.
Alcoholic drinks	861,693,832
Non-alcoholic Stimulants—	
Coffee	120,261,086
Tea	31,171,482
Cocoa	3,000,000
Total	1,016,126,400

The above represents a yearly per capita expenditure for beverages of $14.31 for the 71,000,000 inhabitants of the United States, or 4 cents per day. Evidently hard times have cut down the appetite for beverages of all kinds, and render distilleries hazardous industries. Breweries and coffee mills are far better property.

PLANTING IN SUMATRA.

British capital has found a home in almost every part of the world where it can earn for its owners even bread and cheese, but, as far as we know, the industrial wealth of the Dutch Indies has not received any stimulus from English enterprise. This is certainly not because there is no scope for profitable investment in the rubber, tobacco, or coffee industries of the island of Sumatra, so much as that when the Hollander has a good thing he likes to keep it to himself —as we see every day in the Transvaal.

The cycle trade is making us all very cosmopolitan in our tastes, for we must have rubber to keep the great Dunlop Company earning dividends (as long as may be) on its famous five millions of capital, and the world's supply of this very useful gum is certainly not on the increase. On the East Coast of Sumatra the rubber-tree flourishes, and there can be no doubt that before long an enormous trade will be developed. The natives tap the wild trees, and have been in the habit of exporting considerable quantities of rubber gathered in this wasteful and unskillful manner; but of late years systematic planting and cultivation of the trees has been practised, and in the Tandjong Kassau district already many fine estates have thus been formed. Some idea of the profitable nature of the trade may be obtained when we say that 100,000 trees produce at a low estimate an annual revenue—after deducing expenses —of from £25,000 to £30,000.

Coffee, which in Sumatra is froo from disease, is also a staple product of tho island, and, no doubt, the fortunes which, a few years back, wero made in Ceylon out of its cultivation will be repeated in Sumatra. Taking the yield of each tree as only three pounds, an estate of 300,000 trees should give an annual profit of well over £10,000. Ramie and tobacco are both profitable crops, and it is said that petroleum will also be found shortly among the large exports of the island. Meanwhile, the Dutch companies which are working in Sumatara appear to have been very profitable investments for the dwellers by the Zuyder Zee, as may be seen by the following list of shares dealt in at Amsterdam—

	Premium on Shares. per cent.
Amsterdam Deli Comp. Aand	378
Deli Batavia Maatschappij Aand ..	325
„ Cult. Mij. Arondsburg Aand ..	34½
„ Maatschappij Aand	595
„ Tab. Mij.-pref. Aand	8
„ Langkat Tabak Mij C. v. A. Nom. gor. K.	11
Medan Tab. Mij. Aand	98
Padang Tabak Mij. Aand	9
Senembah Mij. Aand	388½
Serdang Tabak Mij. Aand	15

The field appears to afford considerabie scope for British enterprise, and, provided the management of the plantations is associated with partial Dutch control, so as to cope with the natural exclusiveness of the Government, large dividends should be raised by similar companies which our countrymen may properly establish, and which we hear, efforts will shortly be made to to organise and offer for subscription.—*Sketch*, March 24.

PLANTING PROSPECTS IN BRITISH CENTRAL AFRICA.

An interesting account of planting andprospects of coffee in British Central Africa and German Territory has been supplied to a representative of the *Ceylon Observer* in an interview with Mr. E. Von den Hoff, a gentlemen who had been prospecting for several years in Central Africa, and arrived here recently.

COFFEE,

at Blantyre and Zomba, has been a failure in Mr. Von Hoff's opinion. The first crop is always very good, but the crops after that are uncertain, and for three or four years sometimes there is no margin of profit. Almost everybody has been trying to form Companies as soon as coffee fields are opened, and on could rent out a 200-acre plantation for £100, crop and all. The first crops being so very good, a great many people were induced to settle there.

[All this differs so much from the Reports of Sir H. Johnston, and our own correspondents, Messrs. Moir and Brown, as well as the Nyassaland Company's Manager, that we must await further information.—ED. *T.A.*]

TRANSPORT AND LABOUR.

Transport is miserable and costly; labour is also difficult to get, and has to be got from great distances from the interior. Wages are low, and 4s a month and 1 yd. of cloth a week is the usual wage. A great many planters pay in calico. The labour is procured from different districts in the Nyassa and each head costs about 10s to get down. There were men who carried on work in that direction and they used to bring down 500 to 600 at a time for different planters. They had to send coffee by carriers a good distance to Katongo on the Shire River and load into river boats and pass into the Zambesi to Chinde where it was loaded on larger German boats and taken to Beira for transhipment to Europe.

SOIL AND CLIMATE.

The soil is not very good where estates have been opened. It is a medium quality around Blantyre, and in the interior rather remarkable as regards soil. It is not a country for white men to stay in. I have been away up to Tanganyika and have crossed it and saw nothing in land fit for white settlers. There was plenty of fever—blackwater fever of a dangerous type, and affecting natives also at times. I went up with a caravan to the interior to prospect for coffee-land, and found one portion on the Northern

Nyassa very good for the purpose, but transport will cost so much that it will not pay to open up land there. Labour there was also very poor; the people there do not know how to work properly; they have their banana and manioc plots and remain contented, doing no work. Regarding rainfall in B. C. A. the rains commence in October and continue to December and sometimes commence as early as September. Five months generally in the year they have rain and then no rain at all. The dry season is very bad and the weather very much hotter than in Colombo. There is water in plenty with such large rivers in Blantyre itself, and water is the chief mode of transport.

COFFEE DISEASE.

The trees come into bearing three years after planting, and the first crop is very good, but the following crops are uncertain. Coffee disease has also broken out, the branches dying off completely and trees gradually dying off; they could not account for it though some experts have been trying to find out the cause. Some planters cut out their five or six year old trees, when attacked with the disease, about a foot and a half completely, and new branches come up, the trees being quite bushy like tea. Trees occasionally recover when attacked but a great many die off. On most estates in British Central Africa the disease has appeared. The estates opened up show a large number on paper. Though a good many persons have been trying to form Companies, nothing has been done. The estates are all owned by private owners. At present you can buy land 200 acres in coffee and 300 unplanted, with buildings, etc., and well laid out for £2,000. Most of these estates have their pulping and other machinery, and every year new machinery is being imported. [And yet we are to believe the estates leave no margin of profit!—ED. *C. O.*]

The coffee is of very good quality and they got the best prices of any coffee in the world, realising £115 per ton in England. What with transport and other difficulties the planters do not get more than £60, a good lot being eaten up by middlemen, transport agents, etc.

EXPORTS.

In Tanga (German possession) they have all this while exported only about 200 bags coffee, land being planted about four years ago. They have greater difficulty in the matter of transport and labour.

In Blantyre it was not so bad, but at times great difficulty was experienced in the matter of food there being so many people about.

SUGAR PLANTATIONS.

Several Companies have started sugarcane plantations and very large tracts have been opened out, and they are doing very well. These are chiefly in Portuguese territory on the Lower Zambesi, tracts larger than the coffee estates opened in B. C. A. They must have at least about 1,500 to 2,000 acres in course of cultivation, and there is a very large factory and new machinery ordered from Natal to double the output of the sugar factories, so that they are having double their sugar crops. Two Companies were started—one English and one Portuguese—two years ago, and they are in full swing now. In the matter of export they find things easier and they also do not pay import duty on goods imported, and that is the reason why their plantations are easier.

LIBERIAN COFFEE

has just been planted on the lower portion of the Zambesi by the Portuguese and the prospects are good.

Mr. Hoff leaves this evening by B.I. boat for Tuticorin and Madras, proceeding later on to Rangoon.

THE TEA CROP ESTIMATES FOR 1897—BY DISTRICTS.

By applying to the Chairmen and Secretaries of the various District Associations, we have been enabled to add to the estimates of the current tea crop furnished to the Planters' Association Committee, the acreages in each case on which they were based. From these again we have worked out the average yield for each district, taking only, of course, the tea in bearing into account. From two districts alone—Nilambe and Pundaluoya—have we failed to get the required acreage returns. It will be observed that without these two districts and native gardens, the total area cultivated, in our table, is 314,776 acres and in bearing 246,901, showing 68,875 acres of young tea. It will be remembered that a certain amount has to be added to all these figures to get the exact totals for the island. But meantime the vast majority of districts are fairly represented. It will be observed that the maximum average yield per acre is 567 lb. for the Kelani Valley; while Udapussellawa—strange to say—gives the minimum in 331 lb. We should suspect some blunder here; but we must go by the figures published and sent to us. Dimbula and Dikoya are wonderfully close in their averages —457 and 459 lb. respectively. The table is as follows:—

District.		Acres Cultivated.	Acres in Bearing.	Estimate of Crop for 1897 lb.	Average lb. per Acre.
Ambagamuwa	..	13,862	12,565	5,416,000	431
Badulla	..	12,348	9,121	3,461,625	379
Balangoda	..	5,011	2,211	831,000	375
Dikoya	..	27,577	25,261	11,600,000	459
Dimbula	..	45,059	42.232	19,323,510	457
Dolosbage and Yakdessa	..	15,927*	*	5,726,000	
Haputale	..	13,794	9,556	3,618,250	378
Kalutara	..	14,000	12,000	5,000,000	416
Kelani Valley	..	28,303	22,956	13,621,200	567
Kotmale	..	8,262	7,643	2,853,000	373
Maskeliya	..	18,806	18,128	7,143,500	394
Maturata	..	6,160	5,100	1,833,400	359
Upper Hewaheta	..	3,899	3,436	1,463,350	425
Lower Hewaheta	..	3,771	3,355	1,050,000	313
Nuwara Eliya	..	5,672	4,600	1,922,600	417
Northern Districts	..	39,178	34,217	14,114,981	412
Nilambe	..	..	..	2,000,000	
Passara	..	10,000	7,000	2,800,000	400
Pussellawa	..	17,845	16,135	6,534,600	404
Pundaluoya	..	..	..	1,395,000	
Rakwana	..	4,000	3,565	1,284,600	360
Udapussellawa	..	9,877	6,684	2,203,000	331
Udagama	..	1,425	1,136	525,000	462
Native and unestimated	..	..	..	4,000,000	
		314,776	246,901	119,120,616	

* Insufficient figures furnished to give correct area of tea not in bearing.

It scarcely looks from our Export table so far, as if the total estimated crop for 1897 was to be fully secured? Up to 27th April, our exports of tea are rather over 34 million lb. or 3 million in advance of same date last year; but the excess must be 11 millions over 1896, to give us a total crop of 119 million lb. for 1897. Everything depends on the current quarter, the second, which is always our busiest in the shipments of tea.

PICKINGS WITH A LOCAL APPLICATION.

COFFEE is advancing in popularity in the Mackay district of Queensland. There is little doubt, says the *Queenslander*, that its cultivation will go a long way towards saving the Mackay planters who cannot make sugar-growing pay. It is well-known—bitter experience has taught the lesson over and over

again—that it is impossible to continue for many years taking one kind of crop from the land without returning to it in the form of manure the constituents which that crop specially draws from the soil. This is already becoming apparent on some sugar lands in the Mackay district, and therefore it is well for farmers to learn all they can about coffee, for which the locality is declared by an old Ceylon planter, to be admirably adapted. With annually diminishing yield, and grub and other pests by the cane to contend with, the planter would be in a sad plight were there no opening for him to continue his occupation in some form or other. Coffee seems to present this opening.

From the "Mercury" we gather some particulars of the present position of the budding

COFFEE INDUSTRY AT MACKAY.

For many years past Mr Costello, at Millicent, near Habana, has grown coffee on a commercial scale, and at the present time he has some 35 acres under crop, the splendid coffee from which finds a ready sale in the town. But the attractions of cane-growing appear to have kept others from following his example, and until recently no attempt has been made to extend the industry. However, the failure of coffee in Ceylon and other places, and the rapid rise in the value of the staple, led more or less directly to Mr. John Dansey, a Ceylon coffee planter, visiting Mackay about twenty months ago. With a natural leaning towards the crop of which he had so much experience, he saw in the climate and rainfall and soil of this district an excellent opportunity of establishing coffee-growing on a large and payable scale. A company having a capital of £6,000 was registered in July last year, and acquired some 300 acres at Mount Jukes, Mr. Dansey being intrusted with the work of opening up the estate. No time time was lost, and the necessary buildings were erected, the machinery ordered from Ceylon, which machinery will be here in the course of a month, and a nursery of young coffee plants made. Seed was obtained from all available sources, considerable amounts being taken from locally-grown trees. There is now an a nursery of a hundred thousand plants, which number will be doubled next year, and these have made such progress that planting out has been commenced, and in a few weeks twenty-eight acres will be carrying young trees. In addition to this area planted by the coffee Company, private individuals have planted in the vicinity of Mount Jukes some forty acres on the Bowen road about an equal amount will be put in shortly, while down at Plane Creek small areas are also being put under the same crop. Then the company proposes to increase its area by fifty acres each year, until the whole of the available coffee land on the estate is planted up

The General Exploration the Land Syndicate, Limited, intend to go in for

COFFEE IN BRITISH CENTRAL AFRICA,

after a favourable report by a Mr. Barclay, an experienced Nilgerry planter, and in order to mitigate the ravages of the "borer" and secure other advantages, the planting is to be done under shade. But how? "By planting Liberian coffee among the Arabica"—so that the "shade" as well the crop will give a return.

Among what may be termed

ARTIFICIAL FODDERS

suitable for dairy cows coconut meal is said to have a high value. This fodder is now extensively used in European dairying countries, particularly Sweden and Denmark, where it has become indispensable where stock are kept. The meal has lately been introduced into New South Wales, where it is sold in Sydney in cwt. bags at 5s per cwt. This coconut meal is said to be more largely used in Denmark and Sweden than linseed cake or bran, and is regarded as a very valuable food, not only for cows but for horses, pigs, and poultry. Coconut meal forms part of the daily ration of horses, from 3lb. to 6lb being added to chaff, according to the size of the horse and its work. Mixed with skim milk it is said to be splendid for fattening pigs. Young poultry fatten very rapidly on coconut meal, which, under proper conditions of feeding, gives better results than grain.

New avenues for the disposal of an over-abundant

MAIZE CROP

are always welcome to growers of that cereal, but we doubt whether the latest discovery will meet with general approval in Queensland. It is said that a Chicago man has discovered a process for manufacturing white powdered sugar from corn. The actual tests were made some time since, and were entirely successful. The Chicago Sugar Refining Company is now turning out an article of powdered sugar, made wholly from corn, that is equal to anything on the market. It is a secret process, and the statement is made that it is expected to eventually make all grades, even to a yellow sugar. This new sugar has been put upon the market at about 1½d per lb. less than the "trust" price. It is not of quite so fine a grain as the regular powdered sugar, but this is claimed as an advantage, as it will not cake or become lumpy. It possesses 97 per cent of saccharine strength, against 98 per cent of the regular powdered sugar. The foes that beset the path of the poor sugar cane-grower are multiplying. First beet, now corn; what next?

The industry of

RABBIT PRESERVING

and exporting has attained such dimensions in the South that it is a question whether the benefit derived from the rodent is not greater than the harm it has done. Rabbits have certainly reduced the capacity of the land for carrying sheep and cattle, but their capture has provided work for probably a larger section of the population than have been driven out by their depredations. Some idea of the magnitude of the trade in Victoria alone may be gathered from the fact that last week there was a danger of the cold stores at Flinders street, Melbourne, becoming blocked with rabbits. Although 96,000 had just been shipped in two steamers for England, there remained in store 150,000 rabbits, and the number was being added to at the rate of 10,000 or 12,000 a day.

A project for the establishment of a meat and rabbit preserving factory in the Mount Gambier district is being warmly taken up, and it is expected that business will begin in April and that 2,000,000 rabbits will be sent from the neigbourhood during the coming season. So that South Australia is also entering into the rabbit business in earnest.

BATTALGALLA ESTATE COMPANY.

The seventh annual report of the Battalgalla Estate Company, Limited, is issued, with balance sheet. Here again the 1895 standard is happily maintained. The Directors in their report state that they are pleased to be able again to give a satisfactory account of the Company's working for the past year. There has been an appreciable increase in the yield of tea, the total quantity manufactured having been 222,281 lb. against 170,560 lb. the previous year. The average selling price in London has been 9·62d against 10·44d the previous year, and in Colombo 5·50d against 6·25d. Out of the crop the Company sold in London 174,580 lb. realising net £6,274 16s 3d and in Colombo 43,655 lb. realising net R16,610·20. These figures compare with 126,951 lb. realising net £4,967 9s 6d, and 39,958 lb. realising net R17,901·33 in 1895. Exchange has ruled higher during the year. The original £4,000 debentures having expired were duly paid off. A fresh amount of £10,000 has been authorised, of which £4,000 were issued in replacement of above. The remaining £6,000 will only be issued in the event of fresh property being acquired at some future date. The usual 10 per cent has been deducted from factory account, and £295 from the estimated value of the Asiatic Produce Company's shares owned by the Company. A 5 per cent dividend was paid in October, and 10 per cent is now proposed—15 per cent for the year, same as 1895.—£401 12s forward. The board consists of Messrs. E. H. Hancock, Charles A. Reiss and Adolf Zimmarn. The first gentleman retires by rotation, and offers himself for re-election.—Local "Times," April 29.

TOBACCO AND CEYLON PLANTERS.

(*From a South Indian Expert*)

I have read, with great interest, the various opinions expressed upon tobacco past and future in Ceylon. These opinions call, as you suggest, for a reply from me. A good deal appeared from me under the above heading, in your March and April issues of the *Tropical Agriculturist*.

When comparing your planters' opinions with my own, interested readers must feel that my statements were correct and are justified by facts. With all due deference, most of the writers, who give their experience, show a lack of that practical knowledge of the subject, necessary to make this industry a success.

So far as I am aware (I am open to correction,)—from information gained in the island, from men who were interested in the late Ceylon Tobacco Coy.—tobacco was a success and a great success, so long as the expert or experts from Sumatra had anything to do with it, and failed when, after these men severed their connection, the Coy. worked without them. At all events, there is a startling difference in the prices obtained. Mr. Vollar, whose name has been identified with tobacco from the first, and whose opinion deserves the greatest consideration, says:—"There is no doubt we can grow firstrate cigar tobacco, but so far we have failed in the curing of the tobacco, &c." Now, neither the soil nor the cultivation has to do with the curing of the leaf; this is a process only, and one that is essential after the leaf is harvested. Tobacco is not tobacco until the leaf is cured and fermented. It is obvious therefore, that to be successful, special knowledge is necessary, and like most things, such special knowledge is not obtainable from books. Bad curing will make the best leaf worthless, while good curing will often convert inferior leaf into good smokable tobacco, though possessing the attributes of inferior leaf. Then again "(1) Too tight rolling; (2) Leaf too strong and coarse; (3) liquoring down; (4) antd certain ingredients to improve flavour, &c." are hardly faults of cultivation and could easily be overcome by practical knowledge.

Tobacco necessarily requires attention to business; perhaps more so than any other product, in its handling on the field and off, and the planter who prefers "Tennis, and Mounted Fut" had better not try tobacco, for he will surely fail and fail badly.

The trade at home pay for cigars what they are worth and not what they cost. R15 per 1000 f.o.b. would represent a very poor cigar whether from India or Ceylon, and would, even at that price, find a small sale only. There is no demand for a coarse cigar; what is required is one that is well made, mild in flavour, pleasant in aroma, packed well and manufactured with consideration to the peculiar requirements of the country to which they are to be exported; for such there is a large and increasing demand, and profitable prices are offered and obtained.

It is purely a question of practical knowledge of planting, curing and manufacturing, coupled with an intimate knowledge of the trade.

THE PATIAGAMA CINCHONA CO., LTD.

The annual general meeting of this Company was held at the office of Messrs. Bois Bros. & Co. Colombo, on 1st May, when the following annual Report was adopted:—

"The Directors herewith beg to submit their Fifteenth Annual Report:—The estimate of Tea for the past year was 60,000 lb.: but the actual crop has fallen somewhat short of this quantity, being only 57,431 lb. which was sold in Colombo at an average rate of 49·43 cents per lb. On a reference to the annexed account, it will be seen that the actual working of the year shews a small margin of R1,942·95. The Directors recommend that the balance now at credit of Profit and Loss Account should be appropriated n reduction of Suspense Account, which represents the loss incurred in working the Estate previous to 1890 whilst the Tea was coming into bearing; and they trust the Shareholders will approve of this recommendation. The Shareholders have to appoint a Director in place of Mr. C. E. H. Symons, whose term of office has expired; and it will also be necessary to appoint an Auditor for 1897.—By order, Bois Bros. & Co., Agents & Secretaries."

A special general meeting followed when the following special resolution was passed:—

"That the Directors be empowered to issue mortgage debenture bonds to the extent of £5,000 sterling, bearing interest at the rate of 7 per cent per annum, for the purpose of paying off the existing debentures aggregating £4,000, and to provide funds for the cost of planting tea on the Company's estate."

SALE OF HUNUPITIYA MILLS, NEGOMBO.

Messrs. Baker & Hall have just sold Hunupitiya Mills (bought only the other day) to the Ceylon Tea Plantations Company, which is now an extensive owner of coconut property.

Since writing the above, a correspondent writes:—

"It is the intention of the Company to use the mills as a central depot for their coconut business, their interests in the Negombo district being gradually extended. The mills are said to be capable of turning out 1,000 chests of desiccated coconut and a large quantity of oil monthly."

NEW INDUSTRY FOR GLASGOW.

In about three weeks hence there will be started at Polmadie what is practically a new industry not only in that district but in Glasgow. The manufacture of steel tea chests will form the chief business, and will be carried on by the Acme Tea Chest Company, Limited, at what will become known as the Glasgow Steel Works. In a small way a commencement was made about three years ago in John Street with the manufacture of packages, but so great has the demand now become for the steel tea chests that it was necessary to erect extensive works. After tea growers in India and Ceylon were persuaded to give the new invention a trial, no fewer than 150,000 chests were sent abroad in one year, and during the year closing, which is the third of the company's existence, 300,000 chests have been sent to India and Ceylon. When the new works are in full operation it is hoped that the produce will be something like 1,200,000 tea chests per annum; and that there will be such a demand seems assured when it is remembered that some 5,000,000 chests are used every year, without Japan, and that tea-growers everywhere admit the advantages of the patent boxes over the wooden chests. The new industry will consequently before long give employment to between 500 and 600 workmen, including mechanics, joiners, sawyers, and labourers. Should all go well, it is also proposed that the company produce their own steel plates, as meantime the plates coming from Wales are found irregular as regards hardness and softness. The features of the new steel chest may be summed up thus:—That the same size

carries much more than the old wood chest, the freight is less, the tea is delivered in fresher and better condition in London, and the saving to the grower is considerable. When the chest is made up it has a very neat and clean appearance, and resembles very much an average sized safe. The fact that 1,000 "Acme" chests will bring home 106,000 lb. of tea, while 1,176 wooden lead-lined chests, of the same outside measurement, will be required for the same quantity, demonstrates clearly one advantage of "Acmes" over wooden chests. A saving of about 1s 6½d per 100 lb. of tea arises from using the "Acme" chests. The manufacture of the chests was this week described to a party of pressmen, who were shown over the new establishment. Of course the chests are not made up here, but are sent abroad packed flat in strong wooden cases, holding from 10 to 100, and at the tea gardens they are constructed, the process of putting a chest together occupying only three minutes. The preparation of the plates is an interesting process, and simplicity characterises the whole invention. The top and bottom are of wood, lined with thin metal. The whole surface of the chest inside and out is coated with a solution of lead and tin. After being pickled in acid and washed the sheets are passed through an ingenious machine which performs coating automatically. The sheets are then trimmed to gauge by guillotine machines and taken to the large press, which at one stroke practically makes the body of the chest; between the dies of this chest the plate is stamped and shaped under a pressure of some 250 tons, and when it issues it can be bent in half a minute by hand into the form of a chest, and closed by the patent fastening made simultaneously by the same machine. As they come from the machine, the plates may be shipped off to Ceylon, where they are made into tea chests by the most unskilled of the natives. As regards strength, lightness, and durability, the steel chests far surpass the old wooden ones, and a great matter is that leakage is impossible. At Polmadie entirely new machinery has been laid down, and the company will find great advantage in having the Caledonian Railway siding running into tho works. Coal, for instance, may be placed at the furnace doors from the waggons, while the goods will be conveniently despatched. There is an installation of electric light throughout the works. Mr. Jamos T. Tullis is chairman of the directors, Mr. P. Sturat Brown managing director, and the other directers include Mr. James Couper, jun., and Mr. John Bennie.—*British Daily Mail*, April 2.

EMPIRE AND TEAPOT; IN AN INDIAN TEA GARDEN.

(BY W. R. LAWSON).

Darjeeling.

Tea has become a great cosmopolitan industry. India alone supplies the world with over one hundred million pounds of it every year, which, valued at a moderate average of a shilling per pound, amounts to five millions sterling. Perhaps two out of the five millions are distributed in England in dividends on tea shares.

To India itself tea has been an incalculable boon. Like jute, it is almost a monopoly, and districts of Bengal have been enriched by it which might never have been good for anything else. Assam and the whole frontier country east of Darjeeling were almost impenetrable jungle until the pioneer tea-planters hewed their way in, and transformed the jungle into a garden.

Calcutta as a port owes a great deal to tea. Practically the whole output of the Assam and Darjeeling gardens passes through it, and for the shippers it is a profitable business. One firm in Calcutta ships thirteen million pounds a year—a huge business in itself, and leading to many other valuable contingencies. A member of an old Calcutta firm remarked to me a few days ago. "I sometimes wonder where we should have been if new lines of business like tea and jute had not opened up so providentially for us. It is only five-and-twenty years since I joined this firm, and today we are dealing in hardly a single thing that I began with. They are changing all the time, and we have to change along with them."

Tea plantations are now scattered all over India though by far the largest area of them is in the Brahmapootra Valley running up through Assam. Very fine tea is grown on the Nilgiri mountains, on the west side of Madras province, and not far from the Wynaad gold fields. When

THE FATE OF THE GOLD FIELDS.

still trembled in the balance, some of the pioneer companies, with commendable forethought, provided themselves with large areas of waste land for planting. If the quartz failed them they thought they might find some compensation in tea or coffee.

On the north side of Calcutta the tea gardens most easily reached are those of Darjeeling. They can be included in the regular Darjeeling trip, now the greatest trial that most tourists find in India. You can start from Calcutta by an afternoon train on the Eastern Bengal Railway, dine on a ferry boat, crossing the Ganges at Damorkdea, and breakfast next morning in full view of the Himalayas.

From Saraghat, on the left bank of the river, you travel on a metre-gauge line—the Northern Bengal—to Sibguri, where you change again on to the 2ft. gauge mountain line. This later line—one of the few successes that Calcutta finance has yet scored off its own bat—rises about 8,000 ft. in less than fifty miles. It corkscrews round and round the mountain sides, curling itself into loops, and cutting track above track, until you can look down on three or four of them in successive terraces.

The Canadian Pacific may show some bits of equal magnificent engineering in the Rockies, but it has no such long continuous climb as there is on the Himalayan Railway. The nearest approach to its wonderful scenery is on tho Mexican Railway between the city of Mexico and Vera Cruz, where precipitous mountains have to be scaled by cutting track above track in winding terraces. It lacks, however, the glorious background of the Abode of Snow. The foothills of the Himalayas have a prolific vegetation, the endless variety of which taxed even the descriptive power of Sir Joseph Hooker. The terai, or flat land skirting the foothills, is

A FAMOUS GRASS COUNTRY,

at least by repute, for in this year of universal drought most of it is as dry and dusty as a brickfield. From the terai the little railway climbs first through a semi-tropical belt of ferns and acacias, with feathery bamboos waving over them. Gradually orange trees, lemons, banyans, and cotton trees mingle with the bamboos. Many of them are hung with creepers radiant with bright coloured orchids and convolvulus

This orchid belt covers the lower valleys and extends from 1,000ft. to 4,000ft. up the mountains. Then a third belt begins quite distinct from either of the lower ones. European trees—oak, beech, and maple—intermingle with palms and fig trees, while the ground is carpeted in many parts with European mosses. In this half-tropical, half-European belt we find the tea gardens. Wild tea bushes have shown here and there among the brushwood all the way up. Now and then on a patch of clearing beside a railway station or a native village a young garden may have been seen struggling into existence. But that sort of tea is only for home use. The growers pick it as it comes, dry it in the sun, and in any case are sure of a strong flavour, which is what they most appreciate.

Scientific tea-growing has yet to come. From 2,000 ft. or 3,000 ft. up we may have been passing tea gardens all the time, but they are not visible from the railway. They only come in sight when we rise high enough to look back on them from the crest of a mountain that may have taken us hours to scale. Then the panorama which unfolds itself is superb. Between dense black masses of jungle broad

stretches of bright green flash out in the sunlight. In some cases an entire mountain side has been cleared, and acres of tea bushes are already in leaf. Elsewhere clearing has just begun. Twenty or thirty acres have been cut out of the jungle, and the first planting hardly shows as yet above ground. This year another big cut will be made in to the jungle, and twenty or thirty acres more will be planted. A tea garden in a good district is always extending itself, always.

DRIVING BACK THE PRIMEVAL FOREST,

and adding to the countless rows of green bushes.

At Kursslong, about twenty miles from Darjeeling—that is, on the lower side of the mountains—we get into the heart of an old and well-developed tea district. It is one of the oldest in India, its first garden having been started about 1856. Whole valleys have been cleared and planted, acre has been added to acre till the area of some of them is to be reckoned by square miles. Whole lakhs of rupees had been laid out on some of them, and as a rule well laid out. They are no longer gardens, but "tea estates," and when the proprietors got too rich or too lazy they had themselves converted into limited liability companies, with directors in Calcutta or London, and brokers running after their shares. The manager of a large tea estate generally finds life worth living even in these high latitudes. His white-washed bungalow, perched on a commanding ridge, is conspicuous for miles around. Sloping lawns and bits of garden give it a homely look, and at the same time guard it from miscellaneous intrusion.

But there is one ugly feature it seems never able to get rid of—its galvanised iron roof. Neither slate nor tile is ever to be seen here. It would cost a ransom to bring them up from the terai, and so people do without them. Churches, hotels, Government offices are all roofed with the glistening white iron sheets, which make sunlight hideous. On the tea estates entire houses, or rather sheds, are made of them. The manager's bungalow probably overlooks a hollow crowded with galvanised iron buildings. There will be a group of "firing-houses," where the tea is "fired," or dried, a row of sheds for stores or workshops, an engine-house, with a long, iron chimney, stables for a score or two of hill ponies, and a crowd of huts for the coolies. The headquarters of a large tea estate may form a very considerable village, and it has to be held under very strict rule.

LABOUR IS A SERIOUS ITEM

in the production of good tea. Nearly all the gardens having been formed in what was one desolate, uninhabited jungle, no local labour was to be found. It had to be imported from distant parts of Bengal, and though hundreds of thousands of coolies have migrated to Darjeeling and Assam, the cry is still for more. Tea planting extends year after year, and the supply of labour cannot keep pace with it. Special laws have to be passed to facilitate the recruiting of coolies in the populous parts of the country, and that has become an important business of itself. I travelled lately from Patna to Benares with a free-spoken Yorkshireman, who described himself as a labour agent. He had got a telegram that morning from a tea planter in Assam asking him to send up seventy or eighty coolies at once. He was now on his way to execute the order, and he described to me minutely how it would be done.

He had several recruiting depôts in Oudh, and the North-West, where coolies are thickest. Each depôt had its recruiting agent, who picked up men in the street or on the road wherever he could find them. They were kept till the agent went round, as he was now doing, to draft a new lot. He would select the number he needed, and have them medically examined. Then he would take them before the nearest magistrate and have their agreements read over to them in his presence, the magistrate's duty being to see that they understood the agreements and made them of their own free will. The next step was to rig them out in warm clothes adapted to the hills, and to rig their families also. Finally, they were all put on board a train, with a personal conductor, and sent on to their destination. Usually they engage for three years, and many of them re-engage for a second term. The majority, however, grow home-sick, and return to their native villages to starve.
—*Daily Mail* April 2.

VARIOUS PLANTING NOTES.

CROTON-SEED remains scarce. Two small parcels, totalling seven bags, have come to hand from Colombo, and will probably be offered for sale next Thursday.—*Chemist and Druggist*, April 24.

TAMARINDS.—The first arrival of the new crop *Barbados tamarinds* was offered at auction, but little demand was shown, and the whole supply, consisting of 175 barrels of fine quality, was bought in at 16s. per cwt. Twenty casks of dark *East Indian* tamarinds were also bought in at 9s. 6d. per cwt.—*Chemist & Druggist*, April 10.

THE PRUNING OF TEA.—An old Ceylon Planter at home, who has read the recent correspondence on this subject with interest, thinks that sufficient attention has not been given to the evil effects of gormandizers, which on some estates are allowed to shoot up, to the detriment of the tea bush.

CHANGE OF ADDRESS.—WE are requested to state that from and after the 5th inst. the registered address of the Ceylon Tea Plantations Company, Limited, Central Tea Company of Ceylon, Limited, Digalla Ceylon Tea Estate Company, Limited, Ceylon Proprietary Tea Estates Company, Limited, Travancore Tea Estates Company, Limited, and Selangor Coffee Company, Limited, which have hitherto been 21, Mincing Lane, E.C., will be 20, Eastcheap, E.C.—*H. and C. Mail*, April 2.

NATAL FIBRE.—We (South Africa) have had a call from Mr. D. W. Watt of the Natal Fibre Extracting Company, who is shortly returning to the Garden Colony after a successful business sojourn on this side. Mr. Watt tells us that certain Glasgow folk to whom he submitted specimens of Natal fibre declared the same to be the finest they had ever seen. He is taking back with him a decorticating machine with which he hopes to begin work immediately on his arrival in the Colony.

THE MAYFIELD TEA ESTATES COMPANY.—Notwithstanding the adverse criticism in city papers, this Company has been, we hear, successfully floated, as indeed might be fully expected. The Dimbula estates—Mayfield and Chalmers—are, of course, first-class properties and we hear such accounts of the young tea on virgin forestland on Nicholoya and of the handsome reserves still on that place, as show that in this Matale place also, a very good purchase has been made.

DR. P. C. PLUGGE, Professor of Pharmacology at the University of Groningen, Holland, is about—says *Chemist and Druggist*—to undertake a journey to Java for the purpose of making certain pharmacological investigations in the Buitenzorg Botanical Gardens. The Professor intends to devote special attention to research into the properties of Indian medicinal-plants, and to gather a supply of material for further investigations after his return to Holland. Professor Plugge was formerly engaged as a pharmacologist in the service of the Government of Japan.

A VERY IMPORTANT SHIPMENT OF TROPICAL fruit has been made by the Queensland Government—the first of its kind—as an experiment; and very shortly the consignment will be here. The fruit includes mangoes and pineapples, and these are of the finest description. It is to be hoped that the consignment will arrive in good condition. The Queen has graciously consented to accept some specimens of the fruit, and, if all goes well, some will be forwarded to Her Majesty. The fruit is coming by the "Jumna." The mangoes are from Townsville, and the pines from Brisbane. The fruit is gathered in a nearly ripe state, and it will now be seen whether it is possible, by careful packing and by taking every precaution, to convey tropical fruits from Australia to England in the same way that oranges can undoubtedly be sent.—*European Mail*, April 7.

PRIVATE ESTATES IN JAVA.—For some years the Colonial reports—says the *L. and C. Express*—contain a list of the number and value of the private estates in Java with a specification of the owners, whether Europeans, Chinese, natives, and foreign Orientals. The report of 1895 mentioned that the estates of the Europeans amounted to 29, of the Chinese to 22½, and those of natives and foreign Orientals to 2 million guilders. Since then a modified list has been issued. Successively a number of estates have been converted into limited companies, and the following figures are now mentioned:—Estates of limited companies 16, of Europeans 16, of Chinese 18, of native and foreign Orientals 2½ million guilders. A fault in this statement is that it does not show which of the limited companies are managed by Europeans and which by Chinese.

THE CACAO DISEASE IN MATALE.—Mr. James R. Martin, who has prolonged experience in Yattawatte, writes a reassuring letter on the subject to our evening contemporary. We quote as follows:—

"This disease has existed amongst cocoa in Ceylon for the last 10 years, but in many instances the estates where it first appeared are now doing well and giving good crops. The acreage under cocoa has certainly not increased since 1893, but the crop for the last year was the largest on record by a good deal, and the official estimate for the present year exceeds that. I remember quite well the scare about *Helopeltis*. Cocoa planters were then reminded of the fate of cinchona, and were told that the product was 'doomed' and that they were 'ruined men;' but those expressions merely preceded the five most prosperous years the product has known. No doubt the assistance of an expert will be a great advantage in cocoa and other cultivations, a fact that Mr. Christie has suddenly awoke to."

—Since quoting this, the important letter which will be found on our 5th page has reached us from Mr. J. H. Barber. It will be seen that Mr. Barber discusses the point raised by Mr. VanderPoorten and that he is inclined to the view which Mr. E. E. Green expressed on the stem sent to him by Mr. Gibbon. Still, here is what another cacao grower writes to us:—

"With a specialist on the horizon, to say whether the pest is a poochie or a fungus would not be wise. All the same if it is not a poochie I'll be surprised. It is remarkable how vigorous the suckers come up, if the attack is not too low down after the tree has been cut down."

Now, surely our friend knows how "Specialists" are divided and subdivided now-a-days—he has read of the *savant* who refused to be called a Scientist, Naturalist or even an Entomologist: he only knew of one species of beetles—a subdivision of Coleoptera? Now we have in our midst a working Entomologist—why are his services not availed of?

COOLIES AND PLANTERS.—There can be no doubt of the scarcity of coolies in many directions in the planting districts, and the tricky cheating disposition which is spreading among both kanganis and coolies is much to be deplored. It will inevitably spread much further too, unless strongly discouraged and repressed, no matter at what immediate cost, by the planters themselves. Here is an illustration: a kangani interviews a planter about bringing him a gang of coolies; but first their debts must be paid—these debts consist, say, of R1,000 to the estate they were on and R1,000 of outside boutique and chetty debts. The latter must be paid and the money is wanted for them; but inasmuch as the estate Superintendent refused a "tundu," he, the kangani, having given proper notice, does not mean to pay the R1,000 due to the estate—but will let the owner whistle for it! Fortunately, the Manager applied to was one of a good old school who at once hooted the kangani making this dishonest proposal, out of his presence and off the estate. But are there any Superintendents—hard up for coolies it may be—who would entertain a dishonourable and dishonest proposal of this kind? We trust not. On the other hand what about the refusing of "tundus"—is that right or even wise when application is made in the proper way? We think not; for the risk is thus run of losing both coolies and advances—the only remedy being a civil action—and we all know what that is worth.

"A GENTLEMAN OF JAPAN"—is the heading of an article reproduced in a tiny circular from the Canadian *Grocer*. We quote as follows:—

Mr. H. Komada, Kobe, Japan, manager of the Japan Tea Exporting Association, arrived in Montreal a few days ago to visit their Canadian representatives, Morrow & Ewing, Montreal. Mr. Komada is the founder of the Japan Tea Traders' Association and takes an active interest in its affairs. The association has over one and a quarter million members. In fact, every proprietor and dealer in teas in Japan is required by law to join and obey the bylaws of the association. Mr. Komada says that the Japanese tea merchants are much exercised over the enormous strides which have been made by Ceylon teas in Canada during the last year or so. The advertisements in the Canadian Grocer had interested the trade here in Ceylon teas, and were creating a feeling against China and Japan makes. By constant repetition the trade all over Canada were beginning to believe things about Japan teas that were not altogether fair. Buyers were in consequence turning to Ceylons, and the demand for Japan teas had fallen off very much. Wholesale merchants and dealers who were pushing other makes a year ago were now advertising to the consumer all over Canada nothing but "pure Ceylon teas." The matter had come before the Japan association, and some action would be taken to counteract these influences. It was quite true, he said, that in Ceylon teas were made by machinery, while in Japan they were still made by hand, but he explained that as the Japanese were a very cleanly people there would be no danger of dirt entering their makes, or of disease being communicated. He admitted, however, that the Chinese teas were often very dirty. In fact, he added, that the Chinese were very dirty, and prepared their teas as much with their feet as with their hands.

He found that there were a great many inferior Japan teas coming to this market. They were not shipped by the desire of the Japanese themselves, but by foreign firms. They were what is known as third pickings, and the foreign houses ordered these to get low-priced teas. The Japanese at home would not use them, and they were trying to prevent foreign houses buying and exporting them. Handling of low-priced teas injured the dealers who bought the early pickings at higher prices,

THE STANDARD TEA COMPANY OF CEYLON.

The sixth ordinary general meeting of the shareholders of the Standard Tea Company of Ceylon, Limited, was held at the Registered Office of the Company, 25, Fenchurch Street, London, on Wednesday, the 14th day of April at 12 o'clock, noon.

Among those who were present were Messrs. Alex. Brooke (in the chair), William Rollo, Henry Atkinson, R. A. Bosanquet, John Anderson (of Gorthie), Frederick Hadden, Edward S. Grigson, Thos. S. Grigson, S. Wilson, Geo. Seton, Geo. Stehn, Jas. Mackintosh Smith.

The SECRETARY (Mr. A. Trafford Brooke) read the notice convening the meeting.

The CHAIRMAN said:—Gentlemen, you will, I fancy, take the accounts and report as read in the usual way. You will note the Directors recommend the same dividend as last year, though you have not had the same profits, owing to the increase in the tea not quite compensating for the falling-off in coffee, and the rise in the rate of exchange in 1896. The increase in tea has, however, done pretty well towards filling up the gap. Our first year the income from coffee and bark was nearly half our total income this year the coffee gives about 5 per cent towards total income. It is therefore satisfactory that the tea has done so well, and you see by the report that we have a good deal of land still only partially bearing, or not bearing at all. The exchange has not treated us as well this year as in 1894 and 1895. The close connection of Ceylon with India made us a sufferer in exchange, and the severe famine there did us no good even in the matter of labour in which some thought it might help. It seems a little strange that it should be such an anxiety to Ceylon Planters to obtain labour, while the anxiety of Indian rulers is to find labour for their teeming population. The Ceylon Association and H.E. the Governor have, however, this matter in hand, and it may be hoped they will persuade the Indian rulers into measures to overcome the conservatism of the Northern coolies. I suppose it will not be a much greater difficulty to induce such coolies to come to Ceylon now than it was at first to obtain Tamil labour. The high rate of exchange has been somewhat artificial Money has been very dear out in the East. In the old days the Exchange Banks and others would have purchased and shipped silver to relieve the tightness, but this cannot be done now for the Indian mints being closed it cannot be coined into rupees, so that practically the only way to relieve the scarcity of money was by remittance by Indian Council bills at a high exchange. While our Indian currency, the rupee, is made so much dearer, our tea rivals in China, who have full use of cheap silver, gained 12 per cent on us and 12 per cent on 8d. tea is a penny per lb. That penny is a substantial bonus to the Chinese tea producer. I do not know that I have more to say except that the Ceylon management has continued to give satisfaction. You may hear something upon this subject from Mr. Norman Grieve. Of the purchase of Coneygar I need say little beyond what is told you in the report. The Directors believe it will prove a fair purchase; it is wedged in between our Gordon and St. Leonards estates. I shall he happy to answer any question that any shareholder may put to me, and I now beg leave to move that the report and accounts be received and adopted.

Mr. NORMAN GRIEVE said:—Mr. Chairman and gentlemen, I have much pleasure in seconding the adoption of this report, and I should like in a few words to state the impression I have gained by being out in Ceylon. Of course I saw a great many changes in point of view of labour. Everything is wonderfully altered since I was there. I can see dangers in some quarters and considerable difficulties which will have to be contended with in others. So far as our properties are concerned, I carried away the impression we had very much less to fear than many of our neighbours. I have had occasion to visit a number of estates belonging to other companies during my stay in Ceylon, and in no quarter did I find that any property was more efficiently managed or possessed better managers. In the matter of management I can see difficulties in many places. There are a large number of experienced men who have come home, and consequently there is a considerable tightness in the market for able managers. We, however, have, I am glad to say, in Mr. Bagot and Mr. Craib and the other gentlemen who manage our estates a most efficient staff. In proof of this you need not go further than the report, when you consider that we have not only shown good results, but have increased the price of tea since last year. I think I do not speak too highly of our manager on St. Leonards; his value to the company is great. There are of course drawbacks here and there. All superintendents have now a very anxious time in the management of their labour. Every district has to contend with unscrupulous people who are increasing the advances on coolies in a most reckless way; but this system I regard as tantamount to a rise of wages. It has this advantage—the screw can be put on more easily. When the time comes if you make a specific advance in the rate of wages, it is very difficult to make a reduction. On this advance system there is a possibility of going back to the old system again and dropping the advance. I do not think that on our estates we have suffered as badly as many other places I visited, and I believe this is due to the excellent managers we have on our properties. There is a great feeling of clannishness amongst coolies, and when they are under a man whom they thoroughly trust they are not so willing to move from estate to estate. I can speak with the greatest confidence with regard to the future of the properties. I think that this company can contemplate with comparative equanimity the possibility of difficulty in the money market, exchange, or the prices of tea, as compared with many other undertakings. I was much struck in St. Leonards with the very large amount of undeveloped land. We have a very large area, which has hitherto been under coffee, which is now under tea. Similar land, on an adjoining estate is giving as much as 600 lb. to 700 lb per acre. I should certainly advocate the dismissal of coffee soon because it is a vanishing quantity. I should therefore devote the whole of the valuable area to tea, and not postpone any longer than is necessary the day when it will be bearing tea. We have a valuable and an increasing valuable property to deal with, and I think this company is very much to be congratulated on the position in which it stands. We shall have, like everybody else, to be careful and economical, and endeavour in every possible way to keep down the cost of production. The men we have in charge of our property are alive to this necessity, and are unsurpassed by any I came across during my travels in Ceylon. I have much pleasure in again seconding this motion.

The CHAIRMAN:—Before I put this motion to the meeting I ask any shareholder for remarks or enquiries.

Mr. SETON:—Mr. Chairman, I should like to ask what probability there is of these £6 paid shares, which constitute the chief part of the capital of the Company being paid up in full. Of course, I am quite aware that if we do not want money, there is no object in calling it up, but if they could be paid up without injuring the financial position of the Company, I think the shares would have a greater value on the market.

The CHAIRMAN:—When we started our Company, it was with rather large ideas. We thought we should buy many more estates and that we should call up this reserve, or unpaid liability and use it in paying for these estates never obtained. The ideas of Ceylon estate owners went rapidly far ahead of ours, and we have done very little towards buying property on the scale at one time contemplated with Conygar, the Vendor, stipulated for, and we agreed to pay him in shares. So for the present I do not see that there is much probability that we shall call up that liability.

Mr. HADDEN:— Mr. Chairman, if I am in order,

I should like to know what the Reserve fund is invested in?

The CHAIRMAN:—The Reserve Fund has been used to pay off our debts and is invested in the estates and we have benefitted by it by saving interest and in increased profits. Compare the cost of the estates in the balance sheet £75,000 with the paid-up capital £56,000. If we had not had that £7,500 we should have been owing *pro tanto* more on Debentures on mortgage or something, and you would have been paying interest on it.

A SHAREHOLDER:—I see the price of the St. Leonards tea was higher in 1896 than in 1895—was the quantity as great?

The CHAIRMAN:—The quantity increased also. The Maskeliya is not so satisfactory, as we had an increased quantity and a smaller net result there.

Mr. SETON:—I note, Mr. Chairman, we do not see details of actual crops gathered in. They are not mentioned in the Report.

The CHAIRMAN:—We never have mentioned it.

Mr. SETON:—Then the shareholders have not the pleasure of seeing whether they have increased or decreased their tea crops.

The CHAIRMAN:—They have increased very steadily, indeed you can see that the large proportion of our increase is in tea. The crops of tea were 602,000 this year, 572,000 last.

The SHAREHOLDER:—Nothing to be ashamed of that is clear.

The CHAIRMAN:—If there is no other shareholder who wishes to ask any question I beg to move that the report and accounts be adopted. Those in favour—those against.

The motion was carried unanimously.

The CHAIRMAN:—I propose that a dividend of ten per cent free of Income Tax on the £56,000 paid-up capital be declared, which, with the interim dividend distributed 5th August, 1896, makes 15 per cent for the year 1896; that this final dividend be payable on and after 15th April; that £1,000 be written off for depreciation; that £1,500 be placed to Reserve, and that £800 7s 11d be carried forward to the year 1897.

Mr. ROLLO:—I have much pleasure in seconding that.

The CHAIRMAN:—The motion has been proposed and seconded, those in favour—those against. The motion was carried unanimously.

Mr. EDWARD S. GRIGSON:—I have much pleasure in proposing that Mr. Robert Kay-Shuttleworth, the retiring director, be and hereby is re-elected a director of this Company.

Mr. ANDERSON:—I beg to second that.

The CHAIRMAN:—It is proposed that Mr. Robert Kay-Suttleworth be re-elected a director. Those in favour—those against. The motion was carried unanimously.

The CHAIRMAN:—I have a letter from him expressing very great regret that he is not here today. He is unfortunately detained by severe sickness of his wife, in San Remo, and I beg to thank you in his name for your re-election.

A SHAREHOLDER:—I beg to propose that Messrs. McAuliffe and Davis, Chartered Accountants, be elected Accountants of the Company.

A SHAREHOLDER:—I have much pleasure in seconding that.

The CHAIRMAN:—It has been proposed and seconded that Messrs. McAuliffe and Davis be elected Auditors of the Company.

Those in favour kindly intimate the same in the usual way.

The motion was carried unanimously.

The CHAIRMAN:—Gentlemen, that ends the business of our ordinary meeting: and we now become an extraordinary general meeting.

EXTRAORDINARY GENERAL MEETING.

The CHAIRMAN:—I propose that the capital of the Company be increased to £150,000 by the creation of 5,000 new shares of £10 each.

Mr. W. ROLLO:—I beg to second that

The CHAIRMAN—Gentlemen, it looks a little bit inconsistent, after my remarks to the shareholders, that we should propose to increase our capital at the time when we intimated we saw no immediate use for money, and the only estates we have lately bought we paid for in duly paid shares. We think, however, that times may change, and it might be better to be authorised to leave the option of this extra capital.

The motion was put to the meeting and carried unanimously.

The CHAIRMAN:—This, gentlemen, concludes our business.

Mr. R. A. BOSANQUET:—Before we close this meeting I should like to be allowed to say a few words. I am sure it is quite a pleasure to hear this favourable report; sometimes things look all *couleur-de-rose* and sometimes we see clouds ahead. I have listened with much interest to Mr. Norman Grieve, and it has made me wish that I too might visit Ceylon again; but, perhaps, sometimes it is as well not to get too close to these difficulties. I wish to propose a vote of thanks to the Chairman and directors and to couple with it that of the eminent Agents in Ceylon whose services to the Company are and have been great, Messrs. Geo. Steuart & Co., and I have no objection also to include the estate managers.

Mr. I. MACKINTOSH SMITH:—I have much pleasure in seconding this.

The motion was put to the meeting and carried unanimously.

The CHAIRMAN:—I thank you for myself and my colleagues, the estate superintendents and for Messrs. George Steuart & Co., but there is a gentleman here, Mr. Thomas Grigson, who can more appropriately reply for the last.

Mr. GRIGSON:—After all that has been said it is not necessary I should occupy your time beyond thanking you very much for the Resolution you have passed. To hear of Mr. Grieve's visit to Ceylon shows a favorable prospect for the operations of the Company in the future.

The proceedings then terminated.

THE EDERAPOLA TEA COMPANY OF CEYLON, LIMITED.

The first annual ordinary meeting of the Ederapolla Tea Company of Ceylon, Limited, was held at the office of the company, 16, Philpot, Lane, E.C., on Tuesday, April 13th, 1897, at 2 o'clock p.m., Mr. G. W. W. Paine (chairman), presiding.

Notice convening the meeting having been read by the secretary, the chairman said he supposed they could take the report and accounts as read. He had very little information to give the shareholders on this occasion, it being their first general meeting since the formation of the company. They had had sundry tempting offers made to them to purchase land recently developed, but they preferred to purchase virgin soil and develop gradually for themselves. As the shareholders would notice in the report they had already purchased some native lands adjoining their properties, and they intended, as opportunity arose, to extend their boundaries by the acquisition of any suitable native or Crown lands that might be for sale in their vicinity.

The chairman considered the dividend of 10 per cent a very good one for the first year's working, considering the rate of exchange had been against them. With a more favourable rate of exchange and a better tea market they would hope for an improving dividend. The quality of the tea had much improved since the company had taken over the estates, and great credit was due to Mr. Watt for his continual and successful exertion to improve the quality of the tea. Mr. Paine then gave particulars as to the new clearings, and no questions being forthcoming the following resolutions were put to the meeting and carried unanimously.

Proposed by Mr. G. PAINE, seconded by Mr. PORTER: —"That the reports and accounts as presented to the shareholders be received and adopted."

Proposed by Mr. PAINE, seconded by Mr. MACMARTIN:—That a final dividend of 5 per

cent. (free of income tax), making 10 per cent. for the year, be declared, payable forthwith."

Proposed by Mr. PORTER, seconded by Mr. SIMPSON:—"That Mr. G. W. Paine be re-elected a director."

Proposed by Mr. STOCKS, seconded by Mr. J. C. ANDERSON:—"That Messrs. Cape and Dalgleish be re-elected auditors for the ensuing year."

Proposed by Mr. G. W. PAINE, seconded by Mr. SIMPSON:—"That a vote of thanks be and is hereby given to the Ceylon and London staffs for their efficient working of the Company's] properties and business."

Proposed by Mr. ANDREWS, seconded by Mr. SIMPSON:—"That a vote of thanks be and is hereby given to the chairman and directors of the company."

In responding, the Chairman mentioned incidentally that there was a considerable enquiry for their shares at £14 per £10 share, and the proproceedings were then brought to a close.

THE BANDARAPOLA CEYLON TEA CO., LD

The fourth annual ordinary meeting of the Bandarapola Ceylon Company, Limited, was held at the office of the Company, 16, Philpot Lane, E.C., on Wednesday, April 14, 1897, at 2·30 p.m., Mr. G. W. Paine in the chair.

Owing to very few shareholders being present the proceedings assumed a formal character, and the following resolutions were passed unanimously

Proposed by Mr. G. W. PAINE, seconded by Mr. C. J. SCOTT:—"That the report and accounts as presented to the shareholders be received and adopted."

Proposed by Mr. G. W. PAINE, seconded by Sir George A. PILKINGTON:—"That a final dividend of 5 per cent. (free of income tax) be declared, payable forthwith, making in all 10 per cent. for the year."

Proposed by Mr. G. W. PAYNE, seconded by Mr. H. FRASER:—"That Mr. C. J. Scott be re-elected a director of the Company."

Proposed by Mr. GEO. G. ANDERSON, seconded by Mr. D. ANDREW: "That Mr. John Dalgleish, C.A., be re-elected auditor for the ensuing year."

Proposed by Mr. G. W PAYNE, seconded by Mr. H. FRASER: "That a vote of thanks by given to the Ceylon and London staffs for their efficient working of the company's property and business."

Proposed by Mr. D. ANDREW, seconded by Mr. W. D CAMPBELL:—That a vote of thanks be, and is hereby, given to the chairman and directors of the Company."

The proceedings then terminated.

THE NAHALMA TEA ESTATES CO., LD.

The third annual ordinary general meeting of the shareholders of the Nahalma Tea Estates Company, Limited, was held at the offices of the Company, 39¶ Victoria Street, Westminster, on Tuesday last.

The chair was occupied by Mr. Arthur Marshall, Chairman of the Directors.

The Secretary having read the notice convening the meeting, and the minutes of the previous meeting having been read and confirmed, the Chairman moved the adoption of the report, which, he remarked, spoke for itself. The proposal was seconded by Mr. FORSYTHE, and carried unanimously.

Mr. ABERNETHY proposed, and Mr. S. MACBEY seconded, the payment of a dividend at the rate of 2 per cent. on the ordinary shares, making 6 per cent. for the year. The resolution was carried.

The CHAIRMAN then proposed and Mr. ABERNETHY seconded the re-election of Mr. FORSYTHE, the director retiring by rotation. The resolution was carried *nem con.*

Mr. BATTEN proposed the re-election of the auditors of the Company Messrs. Fox, Sissons, & Co., and the proposal, having been seconded by Mr. FORSYTHE, was carried unanimously.

The proceedings closed with a vote of thanks to the Chairman.

CEYLON TEA LIMITED.

Report of the Directors to be submitted at the Tenth Annual Ordinary General Meeting of Shareholders to be held at the Office of the Company, on Thursday, 29th April, 1897.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending 31st December, 1896, duly audited.

	£. s d.	£. s. d.
The net amount at Credit of Profit and Loss Account, including balance brought forward at 31st December, 1895, and after providing for General Expenses, Directors' Fees, Income Tax, &c, is ..		50,652 16 1
An interim Dividend of 7 per cent. on the Ordinary Shares was paid 28th October, 1896, amounting to ..	11,716 12 0	
It is proposed to pay a final Dividend of 8 per cent. on the Ordinary Shares (making 15 per cent. in all, free of income Tax) which will absorb	13,390 8 0	
Dividends on the 7 per cent. Preference Shares were paid for 1896 (less Income Tax), amounting to ..	5,486 17 3	
It is proposed to add to Reserve Fund ..	14,542 14 9	
It is proposed to write off for Depreciation ..	4,000 0 0	
And to carry forward to next year a balance of ..	1,516 4 1	
	£50,652 16 1	

The Directors are pleased to be in a position to recommend a total Dividend of 15 per cent on the Ordinary Shares, this being the tenth consecutive year in which a like dividend has been declared. It is proposed to write off for Depreciation the sum of £4,000, and to add £14,542 14s 9d to the Reserve Fund, which, with the addition of £457 5s 3d derived from profits on Sale of Investments during the year, will stand at £85,000. The yield of tea was 470 lb. per acre over plucking area of 7,998 acres have and this is the largest average outturn the estates given since the formation of the Company. The yield for 1895 was 437 lb. per acre. The crop for 1896 was as under:—

Estate tea lb.	Bought leaf tea lb.	Tea manufactured for others. lb.	Total. lb.
3,763,167	505,586	1,214,843	5,483,596

The gross price realized for the Company's teas sold in London was 8·14d as against 8·09d per lb. in 1895. The average rate of exchange during the year was unfavourable, compared with that for 1895, being 1s 2 3-6 7-4d as against 1s 1 1-3 5-2d. Appended to this Report will be found a statement of annual crops, acreages in bearing, yields per acre, profits earned, and amounts set aside for Reserve Fund and Depreciation for the last ten years, also a statement of the properties held by the Company at 31st December 1896.

From the Coconut Estates 875,570 nuts were harvested, and the outturn from the Mill at Sirangapathe was 3,016 cwts. of Copra and 3,540 cwts. of Fibre. Another Mill is being erected on the Mawatte Estate, and as the various Coconut Estates come into bearing, satisfactory profits from this portion of the Reserve investment may be looked for.

Mr. H. V. Masefield has been appointed Ceylon Manager in place of Mr. G. A. Talbot, who has retired from that position and joined the Board of the Company. The Directors again cordially desire to express their satisfaction with the work performed by the staff in Ceylon and London during the year. Under the Articles of Association, Mr. David Reid vacates his seat on the Board and Mr. G. A. Talbot,

who has been elected since the last general meeting, also retires, but both being eligible, offer themselves for re-electin.

THE RANGALLA TEA COMPANY OF CEYLON.

Report of the Directors for the year ending 31st December, 1896, to be submitted at the annual general meeting of shareholders, to be held at the Offices of the Company on Wednesday, 21st April, 1897.

The Directors have the pleasureto submit the balance sheet and profit and loss account to 31st December, 1896, duly audited.

The nett profit, including the balance of £952 5s 10d brought forward from last account, amount to		£2,724 14 7
The final dividend for the year 1895 was paid on 9th April, 1896 amounted to	£880	
An interim dividend for the year 1896 was paid on 24th Sept. amounting to	660	
		1,540 0 0
Leaving a sum of.. ..		£1,184 14 7

Which it is proposed to apply as follows:—

In payment of a final dividend of 5 per cent for 1896—free of income tax—(making 8 per cent for the year	£1,100 0 0
Balance to be carried forward to 1897 account	84 14 7
	£1,184 14 7

The Company's produce has been disposed of as follows:—

6,740 lb. tea sold in Bombay and Colombo.
221,620 ,, ,, London.

228,360 lb. tea sold, realizing	£6,219 3 9
5,262 lb. cardamoms gross = 4,842 lb. net, sold in Ceylon, realizing	594 2 1
Total	£6,813 5 10

The sales of tea show a nett average price per lb. of 6.54 pence, being equal to say 45 rupee cents per lb. Exchange for the Company's drafts during the year has averaged 1/2 17-32, as against an average Exchange for 1895 of 1 1 5-16, the difference thus materially and adversely affecting the profit.

The acreage of the Estate is as follows:—

Tea in full bearing	.. 591½	acres.
,, ,, partial bearing	.. 63	,,
,, not in bearing	.. 61½	,,
Cardamoms ...	.. 56	,,
Grass and Fuel Timber	.. 25	,,
Forest and Waste Land	.. 444	,,
Total	1,241	acres.

The yield of tea per acre has been 380 lb.. as against 340 lb. for 1895.

During the year, an additional expenditure of £166 17s 1 d has been incurred on capital account for tea clearings, whilst the sum of £81 5s 1d has been realised by the sale of tea plants. The capital expenditure has again been reduced by writing off £300 for depreciation of machinery, and this policy should be continued.

Manuring has been a great success, both in regard to yield and in the improved appearance of the tea bushes, and it is intended to treat 216 acres during the present season.

The prospects for the current year are quite satisfaerory, the estimated yield being 250,000 lb. of made tea, and 1,500 lb. dry cardamoms, the estate Manager's latest advices reporting 5,000 lb tea and 800 lb. cardamoms in exsces of last year. All hands were busy plucking, and the labour was proving sufficient.

THE POONAGALLA VALLEY CEYLON COMPANY, LD.

Report of the board of Directors to be presented to the Shareholders at their First Annual Ordinary Meeting, to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Wednesday, the 28th April 1897, at 2-30 p.m.

The Directors have pleasure in submitting to the Shareholders the Report and Accounts of the Company for the year ending 31st December 1896.

The net profits for the year amount to £1,831 8s 2d, and this it is proposed to appropriate as follows:—

Amount as above		£1,831 8 2
An Interim Dividend of 3 per cent (free of Income Tax) paid in Sept. amounted to	£525 0 0	
It is now proposed to pay a Final Dividend of 3 per cent (also free of Income Tax) making 6 per cent for the year absorbing	525 0 0	
To write off the whole of the Preliminary Expenses	419 6 1	
		1,469 6 1
Leaving a balance to carry forward to next account of ..		£362 2 1

The Company was incorporated on the 26th October 1895, and the Prospectus issued on the 30th of that month, when the applications for the Share and Debenture Capital were considerably in excess of the amount offered for public subscription.

Since the Company acquired the properties from Sir George Pilkington, a small addition of about 20 acres has been purchased from Government, the land in question adjoining Udahena Estate, and the tota

acreage, as shown in the December Estate Reports, now stands as follows:—

	Tea in bearing.	Not in bearing.	New clearings.	Tea & Coffe.	Coffee
Lunugalla	228	..	47	69	48
Udahena	140	63	59	30	10
Cabragalla	120	23	..	30	25
Poonagalla	117	110	13	..	25
	605	196	119	129	108

	Ravines and Waste.	Jungle and Patna.	Fuel Trees	Nur-series.	Total
Lunugalla	17	363	40	8	820
Udahena	10	322	19	..	653
Cabragalla	17	..	10	..	225
Poonagalla	..	613	7	3	888
	44	1298	76	11	2586

The total crops secured amounted to 204,703 lb. of tea and 1,651¾ bushels parchment coffee (or 337 cwts. 2 qrs. 8 lb as shipped) against Estimates of 200,000 lb. and 1,230 bushels respectively. As coffee will, without doubt, before very long cease to be a source of revenue to the Company, the Directors have thought it expedient to instruct their Managers to plant tea under all the coffee on the Company's Estates, so that when the latter product dies out, as seems inevitable, the former may be well on on its way to supply its place. Where desirable, the Managers have been instructed to apply stimulating manure to such of the coffee as appears to warrant a moderate expenditure, with a view to obtaining in the meantime the most that can be secured from the trees. The Directors have recently had satisfactory Reports on the Estates from Mr. A. T. Rettie. The properties appear to be in good heart, and the Board have authorised the erection of wire shoots where necessary, recognising that any labour-saving appliances are very desirable, and tend to economy in working the Estates. The first of these shoots has been successfully erected betweenn Udahena and Lunugalla Estates, and is working in a very satisfactory manner.

HIGHLAND TEA COMPANY OF CEYLON.

REPORT OF THE BOARD OF DIRECTORS

To be presented to the Shareholders at their First Annual Ordinary Meeting to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Wednesday, 28th April, 1897, at 3-30 p.m. The Directors have pleasure in submitting to the Shareholders the Report and Accounts of the Company for the year ending 31st December, 1896. The Company was incorporated on the 6th April, 1896, and the Prospectus issued on the 11th of that month, when the Shares offered for public subscription were largely over applied for. As mentioned in the Prospectus, the Estates were taken over by the Company as from 1st January, 1896, and the Accounts now presented therefore cover a period of twelve months.

The net profits for the year amount to £2,905 4s. 3d., which it is proposed to appropriate as follows:—

Amount as above		£2,905 4 3
An interim dividend of 4 per cent. (free of income tax) paid in September absorbed	£1,280 0 0	
It is now proposed to pay a final dividend of 3 per cent. (also free of income tax), making 7 per cent. for the year, amounting to ...	960 0 0	
To write off half the preliminary expenses	261 1 10	
		2,501 1 10
Leaving a balance carry forward to nex account	..	£404 2 5

The total Crop secured during the year amounted to 195,020 lb., being about 357 lb. per acre over the Tea-producing area of the two Estates, an average which the Directors hope to see considerably increased in the near future. No acquisitions have been made since the Company took over the Properties, and the total acreage therefore remains as stated in the Prospectus. The Directors have arranged with Mr. R. C. Grant, of Yuillefield, to visit and report on the Company's Estates once a quarter. His last visits to the Properties were early in February when he was able to report that all Estate Works were being carried on in a satisfactory and efficient manner. A new Bungalow will be erected on Chrystler's Farm Estate during the current year, this being a very necessary addition to the Estate Buildings, which was foreshadowed in the Prospectus. In accordance with the Articles of Association the Shareholders will be invited to fix a sum for the Directors' remuneration.

[For report of the Eastern Produce and Estates Co.—see Notes from the Metropolis, 2nd page.—ED. T.A.]

THE KELANI VALLEY TEA ASSOCIATION, LIMITED.

The eleventh annual ordinary meeting of the Kelani Valley Tea Association, Limited was held at the office of the Company, 16, Philpot Lane, E.C., on Tuesday, April 13, 1897 at twelve noon, Mr. G. W. Paine in the chair.

Before proceeding with the business in hand Mr. Paine said that at the desire of the board he took the first opportunity of expressing their great regret at the recent death of Mr. John Anderson, their late secretary and colleague, and practically the founder of the Company, and after some sympathetic remarks, concluded by proposing that a vote of sympathy be accorded to the family of their late friend, which was seconded and carried unanimously, the secretaries being desired to convey the resolution to the family.

Notice convening the meeting having been read, and the report and accounts having been taken as read, the chairman then alluded to the report as not being so favourable as previous reports had been, and dealt with the reasons given in the present report for the shrinkage of profits as compared with those earned in 1895. He mentioned that in addition to the loss of profit occasioned by a higher rate of exchange and a lower market for their teas, there had been a further leakage caused by an error of judgment on the part of their manager, Mr. Mitchell, in entrusting the manufacture of Degalessa Tea to an assistant with not sufficient experience, an unfortunate accident which the directors took immediate steps to correct as soon as the error was discovered.

The CHAIRMAN then stated that the loss of revenue had practically occurred during the last half of the year, for when the accounts were made up in September for the purpose of declaring an interim dividend, the profits then apparent showed a return on the capital of about 20 per cent. per annum, without, however, deducting the usual percentage for depreciation. The increased expenditure over that incurred in 1895 was due, he said to the cost of manufacturing the extra crop of 40,960 lb. of tea, to manuring 200 acres, and, as before mentioned, to the higher rate of exchange. In order to lesson the amount of Mr. Mitchell's work and responsibilities the diretors had given independent charge of Weregalla and Parusella to their sub-manager, Mr. Wyness, and they had every hope that the new arrangement would be for the benefit of the company, and with a view of saving the cost —already a severe item—of firewood, the directors had secured 50 acres of land near the river, where a new factory for Wereagalla and Parusella was to be erected, which would be worked to a great extent by water power, and thus reduce expenditure on fuel.

The chairman then intimated that either he or Mr. Porter, the managing director, would be pre-

pared to answer any questions the shareholders might put to them, when Mr. Mennell said that after the explanations given by the chairman he had little to ask, but he thought Mr. Mitchell deserved great blame for the falling off in quality of the tea, and after Mr. Dodds had referred to the same subject the following resolution was then proposed by the chairman, seconded by Mr. Davies, and carried unanimously: "That the report and accounts, as presented to the shareholders, be received and adopted."

Mr. G. W. Paine proposed, seconded by Mr. Andrew, "That a final dividend of 5 per cent (free of income tax), making 10 per cent for the year, be declared, payable forthwith." Carried unanimously.

On the motion of Mr. Paine, seconded by the Hon. D. A. C. Scott, Mr. D. Andrew was re-elected a director of the company.

Mr. Dodds proposed, Mr. Mennell seconded, and it was carried unanimously, that Mr. James B. Lawrie be re-elected auditor for the ensuing year.

A vote of thanks was also passed to the chairman and directors, and Mr. Paine having replied to the compliment, the proceedings then terminated.

VARIOUS PLANTING NOTES.

COFFEE.—The coffee market has been demoralised by the heavy outturn from Brazil. The downward movement in prices has been very severe, the kinds of coffee undergoing the greatest depreciation being those below 90s. per cwt., the lower the grade the severest being the fall, which in extreme cases has amounted to nearly 16s from the highest point in January; good Santos, which was then worth 51s to 55s for "future" delivery, having recently been sacrificed at 37s 6d to 40s per cwt.—*H. & C. Mail* April 23.

Van Ree; Some Notes upon Fly Fishing in British Guiana, by "Oxon."; Up the Cuyuni in 1857, by William Hilhouse; On the Potaro, by C. A. Lloyd; Early English Colonies in Trinidad, by Hon. N. Darnell Davis; Reports of Society's Meetings, from July to December, 1896.

PLANTING IN THE STRAITS.—In the Annual Report of the Perak Museum we read:—An interesting series of samples from the Trans Krian sugar estate, was presented by Mr. F. Pulsford. Specimens of cleaned Perak grown ramie fibre, and many other vegetable products were added to the collection. Amongst these mention may be made of some particularly well cured liberian coffee from an estate near Gopeng, contributed by Mr. F. D. Osborne. This coffee has been fetching a better price in Singapore than any other produced in the Straits. The high value placed on it is due to its colour and not to any superiority of the bean. The Liberian coffee grown on the hill at Waterloo estate apparently has a finer bean than any from the plains. Some trees planted by Mr. Cecil Wray, in 1880-1, are well grown, vigorous bushes in full bearing, while trees of four years old planted by Sir Graeme Elphinstone, on land cleared twelve years previously, compare most favourably with bushes of the same age on the low lands planted on newly cleared forest land. The collection of Perak woods now numbers 207 examples. It is of more than ordinary interests as it shews that there are so many fine and handsome woods in the jungles besides the four or five kinds known to Europeans.

DIMBULA, April 23.—The Labour question all-important now and for some time in all its various heads and ramifications. It includes all others—plucking, pruning, manuring and everything. It is the "be all and end all" of planting prosperity now and always. And the question of most importance that can occupy your mind and the pith of the *T.A.* is the settlement (a settlement) of an efficient supply of coolies. On a small acreage like mine here the question does not show itself so much, but I have seen flush not very far off on a London Company's estate that might have been shorn with a grass hook, and men get desperate when these things happen!

LIFE IN PALERMO, SICILY.—Some of our readers may remember Mr. J. R. W. Pigott, when a planter on Aluwihare, Matale. He afterwards entered into the service of the Foreign Office as an Agent in British East Africa at Mombasa, and from there he has been promoted to the British Consulate, Palermo, Sicily. From a letter of Mr. Pigott, dated 30th April, we quote some interesting paragraphs as follows:—

"Tea is practically unobtainable here. In one shop Horniman's pure tea is sold, but it is not good and is very expensive.

"I came here last October, having left East Africa in May last just after our rebellion was put an end to. In October 1895 I had a bad attack of congestion of the lungs and applied for six months' furlough in the spring. Lord Salisbury then telegraphed to me that owing to my long service in East Africa he had decided to appoint me to a European post and offered me the Consulate for Sicily to reside at Palermo, which, of course, I accepted as in duty bound. Palermo is, as you know, a lovely place; but the inhabitants are, as a rule, great ruffians and do not compare favourably with my East African friends. There are very few English residents here, and of those all who are able to do so go away for four or five months every year in the summer."

TEA CROP PROSPECTS OF INDIA.—The *Indian Planters' Gazette* of May 1st has the following deliverance:—

As yet it is too early to do anything but make a guess at what the season is likely to be, but rumours are floating about that there is to be a huge increase in the crop of this year, although, upon what grounds this calculation is made, it would be difficult to say. The latter end of 1896 was abnormally dry, and up to date the rainfall has been very scant in the tea districts generally, and the result must inevitably be short outturn. Up to date we have no hesitation in saying that the amount of tea made is not anything like up to last year's; and even if rain does now come it will take the bushes a full month to recover the broiling they have had. Anyone visiting the tea districts must be struck by the want of leaf on the bushes, and unless the plant is in vigorous health, the only outlook is poor quantity and poor quality. It looks as if the season in the three districts were now a days be coming more assimilated to that of Calcutta and Lower Bengal, for it is only within the last few years that there has been what we might call a distinct lull between the "*Chota*" and "*Burra Bursats*," and there is no doubt that this is telling upon many of the older gardens, and when to this has to be added a period of drought of unusual length, the idea naturally is a short crop, *i.e.*, from old tea, for in writing thus we do not take into account the young tea that is coming into bearing, and of which, no doubt, there will be several million pounds. Last season's rainfall was short in all the districts, and what was perhaps more felt, was its uneven distribution. The outlook for all kinds of crops is very depressing, unless there is a good monsoon, and the scarcity of water is being already felt in some parts, more than the shortness of food supplies.

BROKEN TEA AS A DRUG IN THE MARKET.—In our circular of 25th May last year we drew the attention of producers to the contracting value of small leaf broken pekoes, and, as the course of the market since then has fully confirmed our remarks, we would again point out the importance of reducing the percentages of small leaf pekoe fannings, often invoiced as broken pekoe, small fannings, and broken teas of all descriptions A clean *leafy* broken pekoe with some make, and as free as is possible from an admixture of fannings, is to be aimed at, and a good deal can be done towards reducing the proportion of the latter grade by more attention to withering and care in assorting. These remarks apply more especially to those gardens and districts where large crops of ordinary consuming quality are produced. The reason for the receding value of small brokens, a situation which in all probability will become more marked as we proceed, is easily explained, when it is understood that the large and yearly increasing exports to foreign markets from Calcutta, Ceylon, and London, consist practically of leafy tea only, *i.e.*, pekoe and souchongs, thus leaving a comparative over-supply of small broken leaf kinds for home consumption.—*Messrs. Carrett's Calcutta Tea Report*, May 5.

FIJI AND ITS FUTURE.—A correspondent long resident in Fiji writes about its prospects as follows:—

Sir J. B. Thurston's death was a sad one. He was a hard-working Governor. For the Colony's sake I think it is a good thing that a man of entirely new blood like Sir G. O'Brien has been appointed as Governor to Fiji. The Colony will never go ahead till the Government alters all their land and labour regulations. All the land belongs to the natives and they are not allowed to sell nor even to lease without Government sanction and then only for short periods of about 10 to 15 years; I think the latter is the term fixed by Ordinance. There are tens of thousands of acres of jungle which are not likely to be used by natives. Some of this ought to be surveyed and given out *free* to would-be *bona fide* planters if they agreed to cultivate. Unless something of this sort is done they will not get people to go there and invest. The natives ought to be encouraged to go to works, especially the *rising* generation. As I have often stated it is absurd that Fiji with its native population of say 100,000, a large proportion of whom ought to work, should have to import labourers from Bengal, Solomons, Hebrides, and Line Islands. There are difficulties of course, but if the question were properly managed the natives should do most of the work required by the few planters at present in the group. The missionary influence is very strong and all those in authority hitherto have fought shy of interfering with it in any way.

But surely the missionary influence is not against the people working; only we suppose the Fijians—like the Sinhalese—as a rule prefer to be their own masters, doing as much or as little as may suit themselves.

"THE CULTURED PLANTER" is the title of a "skit" contributed to the *Indian Planters' Gazette* in which a tea planter of the old school is approached by the impersonation of the modern class of young Assistants and an amusing interview winds up as follows:—The younger man speaking;—

"We who speak unto you, the nature of whose being we have already defined unto you, require many reforms and ameliorations in our lives as tea-planters, and we consider that tea estates being in such a healthy condition as present statistics prove them to be, that now is the time to bring our wants and desires before those whose business it is to superintend our welfare. We desire more substantial remuneration for the risking of our precious lives in this deadly climate; we desire compensation for cutting ourselves adrift from the society of our fellowmen, sometimes to live upon gardens a score or so of miles away from another European; we desire that considering our expensive education, and the superior intellectual attainments, which we bring to bear upon the science of tea that first-class libraries should be provided at the cost of the company, in every Superintendent's bungalow; that these should include the classics, poets, histories, literatures, biographies, rare volumes of prints, not forgetting a current supply of light novels and books of the day, so that the taste of any moment can be gratified. Regarding the last named we suggest that a monthly box direct from Mudie's, would admirably serve the purpose. "We desire bungalows of uniform perfection, with all the latest improvements of architecture, and artistically decorated, so that our taste in art may not perforce deteriorate by the distressing vision of white-washed walls. We desire a billiard room for every bungalow, and a table of the best procurable; the room of course to be fitted up with all the necessary luxuries, regardless of cost; so shall we maintain our skill at the art of handling a cue, and be fit to compete with our fellowmen when we return to the outer world of civilisation. So also shall our hands and thoughts find occupation during the long, dark, lonely evenings of the cold weather "We require pianos for all—Erard's or Broadwood's for choice—and band instruments with of course a good European bandmaster, would be a pleasant addition to every large estate. The bandsman could be selected from the coolies, and at our dinners the strains of a well-trained band would be a soothing accompaniment to the rythmical measure of the punkah. "We need very urgently punkah-pulling machines guaranteed not to get out of order, a tower clock to be erected near each factory with the same necessary qualifications as the punkah-machines, and punkahs for the tea-house so constructed that they have no effect upon anything except human beings. "We desire bicycles to be provided for every-one, as well as a good supply of horses, a dog cart and barouche and pair, for each man, so that during the hot weather he need not have the exertion of driving himself, also a motor car. We need first-class servants, especially cooks and butlers, supplied free of charge, and an extra supply kept upon each garden in case of emergencies arising; a large ice-machine for each estate is a *sine qua non*, and a matter deeply affecting the health of the Europeans. What would Mr. Labouchere say did he but know that inhuman Directors of tea companies have actually hitherto failed to provide their European *employes* with this necessity of life in the plains of India? The omission is preposterous, and we earnestly charge you to publish the facts in the public newspapers so that the oversight may be immediately remedied, by act of Parliament, if need be."

"One moment," I broke in "forgive my interrupting you, but don't you think all these requirements of modern planters is rather a large order? If you were to go at it more gently now, suggesting, let us say, a billiard table to be provided for each estate, and after getting that to ask for something further, there might perhaps be some chance of getting one or two of the more sensible suggestions taken into consideration; but to go at it hammer and tongs as you

"Ancient Relict of Antiquity," thundered my visitor; "we selected you as our mortal mouthpiece, not as a critic of what modern cultured planters should or should not consider necessary to their welfare! Do not presume to interpolate your pragmatical observations! Be it borne in upon your limited knowledge, that billiard tables and the necessary accessories *have* already been supplied to several estates in Assam at the cost of the company. This is a step in the right direction, and our modest request is that the custom should become universal. "In addition to the needs we have already enumerated we require a steam-laundry, so that our shirt-fronts may be properly starched and ironed; we also desire—" but I could stand no more, and fled from the room, leaving him to vanish to whence he came.

"TIMEHRI."—The only matter to notice in the latest number of this British Guiana Magazine, is a Report on Economic Products exhibited at the Horticultural Show of 1896. But there is really nothing new to us in the report itself—only it is interesting to see the list of products actually shown, which we quote as follows:—(making a few exceptions as to details):—

Class E. Economic Products. Section I.—Open to Amateur Exhibitiors. Coffee (cleaned).—The sample to which we awarded first prize was an excellent sample of creole coffee of almost perfect colour and very well cleaned, its only defect being in some irregularity of the sizes of the beans. That to which the second prize was awarded was distinctly inferior to the former, but still was a sample of high class coffee of not such perfect colour, and not quite so well cleaned. The other samples exhibited were of inferior colour, and in many cases the beans were very imperfectly cleaned. We would impress upon cultivators that if ever this Colony is to again attain eminence in coffee production, it is essential for every care to be exercised so as to obtain coffee of good colour, perfectly cleaned and even in size of bean, especially avoiding the presence of broken beans.

Coffee, Liberian (cleaned).—We cannot accord to this the same praise as to the exhibit of creole coffee The sample to which the first prize was given was dinstinctly the best shown, but all were inferior to samples we have previously examined of this product

Cocoa Beans, (cured).—This class of exhibits was distinctly inferior to the similar exhibits in the Show of 1895. In that Show the first prize was given to an exhibit of fairly cleaned regular sized beans, having a fair break, but somewhat dark in colour. The second prize-ample closely approached the first in quality and we shad some little difficulty in making an award between them. We are inclined to ascribe the falling off in general quality of this class of exhibits to weather conditions, unfavourable for the production of fine full sized beans.

Kola.—Three exhibitors only competed. Two which received prizes ,sent samples of good colour, well dried, and of fair size. The third, although undoubtedly the finest sample as regards size of the nut, undoubtedly had been spoilt in colour during curing,"

Rice, Cornmeal, Plantain Meal, Cassava Meal Farine, Arrowroot, Tapioca, Tous-les Mois.—Never a taking looking starch, the samples exhibited did not add to its reputation; Other Starches. Vanilla.—Two samples exhibited, unfortunately the finer of the two was spoilt by the oil with which it had been dressed having turned raneid; Honey, Tobacco.—This class of exhibits showed us that as last year the curing of tobacco is not understood in this Colony. A faint odour of ammonia, the origin of which is open to conjecture, is not an improvement to leaf tobacco; a mouldy condition again is not usually considered to be typical of merit in tobacco, and these two appeared to be the points at which the majority of the exhibitors aimed. The first prize only was awarded and to a sample in which these points were not present. Cayenne Pepper. Guinea Pepper, Black Pepper, Essence of Pepper, Pimento, Dried Ginger, Pickles, Hot Sauce, Chutnee, Curry Powder, Guava Jelly, Other Jellies, Prepared Chocolate, Crushed Food.

Section II. Open to Artizans and Labourers only.—Preserves, •Jellies, Pickles or Hot Sauce, Coffee (cleaned), Liberian Coffee, Cocoa, Rice, Corn, Starch, Leaf Tobacco, Raw Cotton (cleaned).

A letter was received from Mr. Norman Forster, Manchester, stating it was his intention to cultivate jute in British Guiana, if he gets a land concession.

RHEA FIBRE: ITS CULTIVATION AND MANUFACTURE.—A paper was read before the Indian Section of the Society of Arts at the Im-

lecturer, said that any new raw material be a subject of interest to those engag industry and manufacture. It might also p be of importance to the country as a Therefore he held that no suggestion of material should be scouted or scorned, alth he knew that there were a number of pessi in the world who thought that nothing v importance. It appeared to him that there three conditions which any new material comply with if it was to be of use. 1. must be a fairly plentiful supply of it, actually or prospectively. It was no use t with any material of which only a small qu could be produced annually. 2. It m capable of manipulation, so as to get i the form of yarn or thread that it migh on to the weaver to be woven into a tile. Of course it was possible that machinery might be required, and th opportunity would be given to inventor there must be no absolute bar to the m lation of the material. 3. The cost mus be excessive as compared with existing mat except in cases where the material disc might be possessed of some special beau characteristic of its own. Mr. Barraclou the outset of his paper, said he thought he be able to show that rhea fibre complied the three conditions laid down by the man. He maintained that it was the str fibre known, and the longest of all textile with a brilliancy or lustre superior to all In certain classes of goods only an expert distinguish between silk and ramie (a generally used name for rhea). After disc the best methods of cultivation, Mr. Barra inquired into the causes of the failure fibre. This he attributed largely to ign of its nature and requirements by pl Climate and soil also had been unsuitabl the treatment mistaken. The so-called d cating machines had further contributed to f because in removing the skin they had removed the internal pith or wood, pro what were called in the trade "ri Similarly a large proportion of the ming processes injuriously affected the streng lustre of the fibre, making it harsh and and difficult to dye. Mr. Barraclough sa ramie could never supersede silk, althou conjoint use of the two materials in daily. Ramie might, however, be expec supplant flax in certain descriptions of while in mixed woollen goods it would less play an important part. Everything to a gradual but certain development. A discussion, in which Mr. S. G. Lane-Fo Macdonald, and others took part, the ch said that the difference of opinion whi been expressed as to the best manner o paring ramie for textile use would perha fruit. As to its cost, it must not be ex It must come into something like the cotton. He thought it important that th ment of ramie should take place on t where it was grown. This he said, s from general principles, was to avoid freigh dently there was much to be done in t lopment of this fibre. Manufacturers m give it up in spite of the disappointm twenty years, but must pursue the questi

IMPERIAL CEYLON TEA ESTATES, LIMITED.

REPORT OF THE DIRECTORS to be submitted at the Annual Ordinary General Meeting of Shareholders, to be held at the Company's Offices, 9th, Fenchurch Avenue, London. E.C., on Thursday, 22nd April, at 3 o'clock. The Directors have pleasure in submitting the General Balance Sheet and Profit and Loss Account to the end of 1896, duly audited.

The nett amount at credit of Profit and Loss Account is £3993 4 10

It is proposed to pay a Dividend of 5 per cent (free of Income Tax) on the three issues of Shares from the respective dates that they rank for dividend, viz :—

Shares :—Nos. 1—5,215, from 1st Jan, to 31st December, 1896.
Shares :—Nos. 5,216—7,200, from 1st March to 31st December, 1896
Shares :—Nos. 7,201—9,000, from 1st June to 31st December, 1896.

This will absorb £3,959 11 8
and the balance will be carried forward.

The result of the Company's operations has not been as satisfactory as was originally anticipated. This is partly due to the disappointing working of the Mottingham and Binoya Estates from the 1st July, 1895, until they passed into the actual possession of the Company, and partly to the high level of exchange during the year, as compared with the moderate prices ruling in the Tea market, in addition to which, the change in Proprietorship and Superintendence of the several Estates, acquired since the Company's formation has somewhat disarranged the working, and affected the profits.

The Company's properties, however, are now all in thorough working order, and the Colombo Agents report favourably of the prospects of the present season. The Directors are satisfied that the Shareholders may look with confidence to much better results in the future than is shown by the first year's working.

The following is the total acreage of tea, &c., forest and waste land, and the crops secured to end of 1896 :—

	Tea Acreage.	Coffee Acreage.	Forest Waste.
Binoya	441	—	458
Mottingham ..	221	—	37
Edinburgh ..	382	—	50
St. Vigeans ..	185	—	—
Friedland ..	163	—	2
Nonpareil ..	200	200	149
	1,592	200	696

	Tea Crop in lbs.	Coffee, in bushels.	Cinchona in lb.
Binoya	211,990	—	—
Mottinghan ..	105,328	—	—
Edinburgh ..	132,378	34	—
St. Vigeans ..	51,215	—	—
Friendland ..	41,522	—	—
Nonpareil ..	—	863 13-16	39,260
	542,443	897 13-16	39,260

The tea crop figures represent the quantity despatched by each estate, from the date on which it was taken over by the Company.

THE ALLIANCE TEA COMPANY OF CEYLON, LIMITED.

The Directors have pleasure in submitting the general balance sheet and profit and loss account for the year ending 31st December 1896, duly audited.

	£ s. d.	£ s. d.
The net amount at credit of profit and loss account, including the balance brought forward, is ..		5,120 10 8
An interim dividend of 5 per cent was paid on 17th Sept. amounting to ..	2,500 0 0	
It is now proposed to pay a final dividend of 5 per cent (making in all 10 per cent per annum, free of Income Tax), which will absorb	2,500 0 0	
and to carry forward to next year a balance of ..	120 10 8	
		5,120 10 8

As will be seen from the accounts, the directors have acquired—for the very moderate sum of £541 16s—the Kehelgama estate, adjoining Aberdeen. The property is 322 acres in extent and will be valuable for Aberdeen as a Timber Reserve. The capital expenditure has been further increased by outlays on tea clearings, buildings, &c., amounting to £1,615 5s 2d, against which the directors have written off £300 for depreciation of machinery, &c. The directors have also entered into arrangements for the purchase, as from the 1st January last, from the Dunkeld Estate Company, Limited, of the Dunkeld Estate, in the district of Dikoya and adjoining the Company's Elstree property. This should prove an advantageous arrangement, as Dunkeld is a valuable tea garden and is very centrally situated for working in with the Company's other estates.

The average exchange for the year has been 1s 2 31-64d as compared with 1s 1 29-64d last season, and this has materially increased the sterling amount of the estate expenditure.

The following is the total acreage of tea now in bearing, forest and waste land, and the crops secured in 1896.

	Tea in Bearing.	Forest, Waste, Grass.	lb. of Tea.
Aberdeen ..	387	93	137,545
Calsay ..	351	36	109,260
Luccombe ..	717	200	245,030
Gleneagles ..	222	—	90,442
Uda Radella ..	450	105	167,368
Thornfield ..	255	35	133,147
Kehelgama ..	—	322	—
Total ..	2,382	791	882,792

As compared with last year these figures show that the tea in bearing has been increased by 143 acres, and the production of tea by 58,294 lb. The reports from the Agents and Managers in Ceylon, continue to be of a satisfaotory character, and the directors look forward with confidence to a favorable result from the present year's working.

MANGOES IN ENGLAND.

"Imperialist" in the *Colonies and India* writes :—The consignment of tropical fruit from Queensland to the Agency here arrived in excellent condition so far as the mangos went, but the pineapples, unfortunately, were spoiled. There were about sixteen cases in all, and one case of mangos in fine condition was sent to the Queen. Cases of the other mangos went to Mr. Cham-

state. The fruit was put in a cool chamber, and it seems to have been overlooked that in the cool chamber any article remains in *statu quo*, and thus the fruit arrived exactly as it left, unripe, and naturally after the voyage this unripeness could not be remedied. However, the fact that the mangos came in a satisfactory state is gratifying, and shows that, if the fruit is gathered in really good condition, it can evidently be imported here in a state fit for market.

COCONUT CULTIVATION IN SAMOA.

The single exportable staple for which Samoa is eminently adapted, and the one upon which all its business at present rests, is the coconut (*Cocos nucifera*). It is to Samoa what cotton and corn are to the United States; all that grain, meat, and wool are to the Australian Colonies. The export of the copra alone, save with trifling and inappreciable exception, represents the entire agricultural productive capacity of Samoa, and through this source all the money that trade and commerce bring into the islands finds its way. The United States Consul-General at Apia says that if the coconut crop were an absolute failure for a single year, the entire export of the kingdom would not amount to more than £1,200 and this illustration will adequately represent the prime importance of this single article to the country and its needs. The accepted method is to plant the coconuts in rows forty feet apart, setting the trees thirty feet in the row. The coconut loves the sunshine and free circulation of the air, and to flourish in perfection it should stand on the outer verge of the sho e, its roots striking into the sea water, its branches or palms tossing in the breeze. The lowlands of the beach in the Samoan Islands are more or less covered with the groves, while on the mountains or highlands no tree is found. The smaller size of the trees and the poorer yield is plainly to be noticed on lands at an elevation of from 400 to 600 feet situated at as short a distance as 2½ and 3 miles from the shore. Standing immediately on the beach the tree inclines outward over the water; growing inland it points by its leaning in the most direct way to the sea. The nuts ripen throughout the year, hanging in clusters close in and around the stems of the palm branches, which spread about on all sides, and reach upward from the clustered head forming the top of the tree. The height of the trees, is from 30 to 80 feet. The trees come into bearing at the sixth year on suitable soil, and are believed to reach the full limit of production at from 15 to 20 years of age. Many groves known to be 30 and 40 years of age are now bearing in undiminished abundance, and they so continue to do to a great age. Persons who profess to be able to determine the age of trees by the marks left on the bark where the branches have successively fallen, estimate in this way that many still vigorous trees are 70 and 80 years of age. The habit of the coconut to reach out over the water, seems to be a provision of nature for its propagation and distribution. The nuts falling into the sea will float for weeks in the bitterly brackish waters of the tropic seas without injury to the germinating quality. Once thrown upon the warm sands of a beach, or tossed by a wave upon a reef above the surface, it soon puts forth its palm from the smaller end, while from the round and larger end the tender roots strike into the soil or decayed coral, as the case may be. Many lagoons which have risen within living memory, and which for years remained without sign of vegetations are now covered with the coconut, although hundreds of miles from other islands. The value of the coconut is not confined to the single export product, copra. The tree and its products are devoted to many uses. The wood in the green state is very porous and spongy, having consequently a great degree of resistance to rifle shot. In the native wars in the past it was much employed in the building of defensive works. When thoroughly seasoned it lasts for a long time underground; and is valuable for all purposes for which posts are employed. The oil enters in many forms into the domestic uses of the natives. It forms the basis of all their liniments and emollients in their pharmacopœia. The nut is one of the standard articles of diet. Breadfruit, taro, bananas, and coconuts form the staple articles of food, ranking in importance in the order mentioned. The fibre furnishes all the sennet, or braided twine and rope, for all uses. The leaves of the great branches, which dry rapidly, are used for kindling, for torches, and light and firing for the household. It is generally estimated that an acre of land should yield, when the trees have reached the period of full bearing, about half a ton of commercial copra. Copra "making" is at best a slow and laborious process, and is effected as the nuts ripen, from about the middle of April till the middle of October or early part of November—that is during the dry season, but the making is more active in July, August, and September. A boy or man, with a piece of sennet about eighteen inches in length, looped on either foot, will climb the slender, swaying tree with as much ease and rapidity as if it were a ladder. The notches or corrugated surface of the bark catches the bit of sennet between the feet, while the weight of the body pressing downward, clamps as it were the hollow of the feet firmly on either side of the trunk. By this means the tree is ascended by a series of jumps. The climber with a big knife cuts away the matured nuts, which cluster close about the butts of the branches. As they fall they are gathered into piles about the base of the trees. On the plantations they are gathered into baskets slung on donkeys, or swung on poles borne by two men, to be finally piled into great heaps near the copra shed. The nuts are not husked, the thick outer husk having become hard and brown, like wood. They are dextrously split in two by an axe, and the hard white flesh is cut out with a large knife. Nothing remains but to spread it on mats or boards in the sun. When cured it is thrown into a heap in the shed, where it remains until placed in sacks to be carried out to a small boat, which in turn transfers it to the small schooner or cutter lying in deep water, and from this in turn it is again taken to be stored elsewhere, or transferred to the deep sea vessel for its final voyage. Copra yields perhaps a greater per-centage of oil than any other of the great oil-producing staples under the modern process, whereby it is mixed with water, heated, and subjected to two pressings, giving as high as 62 and 64 per cent. of pure oil. The coconut crop of 1894 was by far the largest ever known in the island, and the extent of the increase is illustrated by the fact that while the export of copra in 1891 amounted to 4,842 tons, in 1892 to 4,871 tons, and in 1893 to 4,602 tons, it rose in 1894 to 6,214 tons, an increase of 1,612 tons over the year before—an increase of about 33 per cent over the years 1891 and 1892. In the trading stations in Samoa enormous profits are made in the copra trade.—*Journal of the Society of Arts*, April 9.

AMSTERDAM CINCHONA-MARKET.

Our correspondent writes that the Amsterdam cinchona-market remains extremely firm. All the lots bought in at the last auctions have since been sold at prices fully equalling the unit-rate at the auctions. There appears to have been an error in the figures of the Java shipments in March as first telegraphed. A corrected message gives the March exports at 578,000 half-kilos instead of 350,000. At the next auctions on May 6th at least 5,834 packages of bark (possibly more) will be offered for sale The feeling in the market is firm, and higher prices are expected.—*Chemist and Druggist*, April 17.

RAISING DUTY ON NATAL TIMBER.

Hitherto black wattle poles from Natal have been admitted into the Transvaal on a 1½ per cent. duty. This (says the *Comet*) has suddenly

been raised to 7½ per cent. without further notification than a demand at the Customhouse for the increased duty. In such matters the authorities might be reasonably expected to give importers adequate notice, instead of springing such a change upon them without any warning.—*Natal Mercury*, April 2.

TEA CROP ESTIMATES AND DISTRICTS.

The difficulty attending the estimating of the tea crop for districts that may be said to run into, or overlap, each other, may be judged from the following extract of a letter sent to us by Mr. Alex. Wardrop of New Forest, Deltota:—

"Referring to your letter of 24th April, I have collected statistics of acreage under tea in the Nilambe district, which show a total of 1,875 acres of tea in bearing and 640 acres not in bearing. I would point out, however, that probably all the Upper Nilambe estates have already been included in the Pussellawa return, as these places belong to that P.A. as do also some in Ramboda and others near Gampola. The Pussellawa district, as defined in the Directory, cannot claim anything like the 17,000 odd acres in tea with which it is credited in the published returns."

Of course, the Committee of the Planters' Association in calling for crop estimates must have taken care to define the several districts. It would be safest, we think, to follow the Estates Directory as it is in everybody's hand and one estimator could not then fail to know what the other was doing.

TEAS IN UNITED STATES: REPORT PREPARED BY A COMMISSION OF EXPERTS.

The following has been sent to us by our Tea Commissioner in America:—

It will be remembered that under the Act of Congress approved March 2nd, 1897, and entitled "An act to prevent the importation of impure and unwholesome tea," it was provided that a board of seven tea experts should be appointed by the Secretary of the Treasury to establish standards in advance of the tea season for the guidance of the tea examiners at the various ports. The following gentlemen were appointed upon this board:—E. A. Schoyer, of E. A. Schoyer & Co. Chicago; A. B. Upham, of Sprague, Warner & Co., Chicago; H. G. Woodworth, of Robinson & Woodworth, Boston. A. P. Irwin, of Irwin McBride, Catherwood & Co., Philadelphia; Wm. P. Roome, of Wm. P. Roome & Co., New York; Thos. A. Phelan. of Geo. W. Lane & Co., New York; R. B. Bain of San Francisco. The law provided that a Chairman should be elected by the board, to whom all communications should be directed, and upon the first meeting of the board in the Appraiser's Office, in this city. Thos. A. Phelan was elected Chairman. Mr. Phelan in an interview with a representative of this journal yesterday summarized the work of the board as follows:

"The Board devoted itself to the establishing of standards the whole of last week and have established the following standards:—

No. 1—Formosa Oolong.
No. 2—Foochow Oolong.
No. 3—Amoy Oolong.
No. 4—North China Congou.
No. 5—South China Congou.
No. 6—India Tea.
No. 7—Ceylon Tea.

"In each of these standards the maximum percentage of dust and fannings must be of limited amount to be settled latter. This percentage of dust and fannings is liable to be made up of extraneous matter.

No. 8.—Pingsuey green tea.

"As this standard is of better make or style than was necessary to represent the quality of infusion the rule must be specially emphasized to examine with reference to liquor and infused leaf only.

No. 9.—(A) Country green tea.
No. 10.—(B) Country green tea.
No. 11.—Japan tea, pan fired.
No. 12.—J pan tea, sundried.
No. 13.—Japan tea, basket fired.

"Dust and fannings, in the last three mentioned standards, a e not to exceed a limited amount, to be settled latter.

No. 14.—Japan tea, dust or fannings.
No. 15.—Scented orange Pekoe.
No. 16.—Capers.

"It is understood that the comparison of the standards with teas delivered must be made upon the drawing of the tea as well as the appearance of the leaf after infusion, and that little or no consideration will be given to the make or style or color of the teas in the dry leaf.

"The standards selected for Oolong, including Formosa, Foochow and Amoy teas, are about two grades above the very lowest quality that has heret fore been admitted, so that hereafter anything under what would be called good common to fair Oolong will be excluded. The same applies to Congou teas as well as to India and Ceylon.

"Great care was given to the selection of standards for Pingsuey green tea, as this is a kind of tea which has heretofore been mixed with spurious leaf and has had an excessive amount of coloring matter, making it unfit for use. The standard selected is absolutely pure, having entire freedom from any scum, and it also has a clean green leaf after infusion, so that such a tea in the future will be free from all objection and have some merit. The same applies to the two standards selected for country green teas, which practically exclude all the kinds known as low grade of Shanghai packed, excepting, perhaps, the very best of this description. It will also exclude what is known as 'Smoky Tychow teas,' with scum in the liquor.

"The Japan tea standards represent about two grades above the lowest quality heretofore admitted and might be called in the trade as good common to low medium grade. They are free from any objection in drawing quality or scum, or exhausted leaf. The same applies to the dust or fannings which will probably exclude about 1-4 to 1-3 of the amount of dust and fannings previously admitted, including all with excessive coloring matter and scum.

"The standards selected for scented orange Pekoe and capers are of the very finest quality and have no objectionable characteristics.

"It is to be hoped that the Tea Examiners at the three ports of entry, Chicago, New York and San Francisco, will be men of such character as to be thoroughly reliable in order to make this law effective. Upon these three men will depend whether this bill will be a success in carring out the object of providing for the American people teas absolutely pure and without objection. If they do their duty the finest crop of tea that has ever come to America will be in the possession of the American people next season, beginning June 1st."

PRUNING, PLUCKING AND PREPARATION OF TEA.

Dooars, April 17.—Preparation in the factory is now more carefully supervised, and, owing to improved machinery and good buildings, carried out in a more systematic manner. To make good tea there can be no hard and fast line drawn between field work and factory work. The greater the care taken fro n the pruning of the bush in the cold weather up to the time it is packed, the better the quality is likely to be. No one has yet discovered, and I don't think ever will, a system whereby leaf which has been grown on sickly bushes due to bad pruning and bad cultiva-

tion, or allowed to become old, before being taken off can be made into tea of good quality in the factory. Carelessness in the factory may spoil good leaf, but, as a rule, I think the factory gets more than its fair share of supervision in the plucking season. When we think of the number of hands employed in the field as compared with the factory, at least 10 to 1, probably 15 to 1, and very often one European in the factory and one in the field only, the deficiency of supervision of the latter becomes more apparent. Again, in the field, in plucking each bush should be plucked according to its growth, and every individual shoot in the same way, so as to secure evenness of quality. Leaf plucked unevenly upsets nearly every stage of manufacture. Young leaf withers more quickly, rolls easier, ferments more quickly than older leaf, hence if we attempt to do what we should for the young leaf, we do not treat the older properly and *vice versa*. Again in the factory we deal with three or four maunds of leaf at a time, and so many of the machines are now automatic that less supervision is required than in the old days of hand rolling and *chula* firing. The weak point in this district lies, I think, in the plucking, not only as regards quality, but also in regard to quantity.—*Indian Planters' Gazette.*

NATAL TEA.

Mr. J. Fraser, the lately-appointed manager of the Barrow-Green Tea Estate, Natal, is to be congratulated on the successes he has scored with his teas. The Barrow-Green teas took first prize in all three classes, viz., golden pekoe, orange pekoe, and pekoe souchong; and also the gold medal for the best exhibit of teas of all kinds. The judge in his report says:—"Upon the general quality of the first prize teas, I think it shows a distinct advance. The teas are well made, the leaf is young, and the liquor strong, and there is an absence of the usual herby flavour so prevalent in teas from Natal. A special prize is awarded, notwithstanding that only one competitor exhibits in this class. A full set of teas also exhibited but no competitor. I think a prize (or at any rate some recognition) should be awarded considerable trouble and expense having been incurred by the exhibitor, who could not foresee that others would not compete." Mr. Fraser's success is all the more gratifying to him, inasmuch as he is a new arrival. He only reached Natal from Ceylon, on February 28th; but on hearing that an exhibition was to be held here a fortnight ahead, he proceeded without the loss of an hour to prepare his samples which are now on exhibition, although when Mr. Fraser arrived the leaf had not been plucked nor even the cases made. Mr. Fraser's energy has happily been well awarded.—*South African Republic,* March 18.

THE VALUE OF AGRICULTURAL EDUCATION IN INDIA: A HINT FOR THE LOCAL GOVERNMENT.

The Government of Bombay have (says the *Times of India*) taken a most prudent and necessary step for the encouragement of agriculture. It will be remembered that the Famine Commission recommended - in accordance with the declared policy of Government—that the Revenue Department, the officers of which are intimately concerned with the agricultural interests of the country, should contain a leaven of officers possessing some knowledge of agricultural science and practice. Since then a conference has been held presided over by Mr. Chatfield, Director of Public Instruction, and including among its members the Director of Agriculture, Sir E. Buck, the Secretary to the Government of India, in the Revenue and Agricultural Departments, and Mr. Ozanne, the recommendations of which were adopted by the Government of Lord Sandhurst. The result has been the declaration that Government is ready to place holders of the agricultural diploma, according to the higher standard now to be exacted, on a par with graduates of the University for employment in the Revenue Department. Says the *Times of India*:—we congratulate the Government on having taken the shortest road to revive interest in agricultural study and to obtain for the Revenue Department a body of men instructed, and therefore likely to be interested, in a science, the practical importance of which to the interests of the people can hardly be exaggerated.

We think it high time that our local Government thought of placing the Colombo Agricultural College on a proper footing, instead of allowing it to languish as it has been doing for lack of proper support and a liberal policy. Below we give recommendations with reference to Agricultural Education in India.

THE AGRICULTURAL EDUCATION POLICY IN INDIA.

Among the recommendations made by the Committees appointed to confer with Sir Edward Buck at the instance of the Government of India are the following:—

That agriculture should not appear as a separate subject in the curriculum of rural primary schools, but that the effort should be to impart an elementary knowledge of it in the group "object lessons and elementary science" which group should be made a *compulsory* subject.

That agriculture should be recognised as a separate optional subject for boys after they have passed the Fourth Standard, and that until properly qualified teachers become available, the study of a text-book of agriculture in Lower Secondary schools will be better than nothing.

That the first necessary step is to provide for the training of the teachers of Lower Secondary and Primary rural schools, and that to this end every training institution, where such teachers are trained should have on its staff a master qualified to teach agriculture and have attached to it a school garden.

That to secure an adequate supply of trained teachers for the rural Primary and Lower Secondary schools, an agricultural class should be developed in selected educational institutions where the general education will be carried on up to the Upper Secondary Examination, and special education in agriculture up to the intermediate standard. Such classes will need a small demonstrational farm for teaching purposes.

That the early establishment of experimental farms as separate organizations, and designed for carrying on agricultural investigations, is desirable.

That a list of the principal agricultural defects of different districts should be drawn up, and that these should be gradually investigated in the order of their importance.

TEST-SOLUTION FOR CINCHONA ALKALOIDS.—A mixture of equal parts of a 10-per-cent solution of sodium thiosulphate and a 5-per-cent solution of copper sulphate. Add this drop by drop to the liquid to be tested. In presence of quinine, quinidine, cinchonine, or cinchonidine, a yellow, amorphous precipitate is formed within a minute.—*Jowcrowski.*

THE NEED OF THE DAY IN CEYLON: "A DEPARTMENT OF AGRICULTURE."

Ceylon, although ahead in much, is still behind in a good deal as compared with its neighbours. So much of our prosperity depends on Agriculture, that one would naturally conclude the Government would see to it that every kind of scientific assistance was rendered to those who are engaged in the work, and when difficulties arose, or a blight of any kind threatened the prosperity of any of its branches, that there was a Department of Agriculture to which men might go for expert advice. But as we all know, this is not so. Just at present there is considerable anxiety as to where the cacao pest may land its planters and those dependent on the industry. It may be something else later on; indeed there is much even now that ought to be studied in respect of our tea and coconuts, not to speak of minor, new and untried products. India has its Agricultural Department and special officials—so has Java, where indeed all the cadets for the Covenanted Civil Service have to acquire a special grounding in Agricultural knowledge before they are allowed to take up revenue or administrative work. In Java, moreover, there is a considerable scientific staff ready at all times to turn its clear light on obscure causes of destruction, and to work out the life history of enemies of products as well as to suggest and experiment with remedies. But here we have not even an Entomologist in the Government service to verify a "poochee"—much less an allowance made to a competent Entomologist available on the spot—but have to depend on the gracious services of private observers who have taken to the study for pure love of it.

When one thinks how much money is at stake in connection with the Agriculture of Ceylon; how every race which people this island are more or less employed in it; how even the very stability of the Government depends on its prosperity, it is passing strange that so little is done to guard its interests or guide its destinies. When an Entomologist was asked for by the Planters' Association, the request was refused, and it is only when the steed has been stolen that our authorities bestir themselves and endeavour to lock the door, by promising to import a specialist to ferret out the reason for the large mortality in cacao, but without the proper preliminary inquiry by Messrs. Willis and Green to show in what direction—if any—the services of a scientist from Europe is necessary.

A London merchant, who has interests in cacao in Ceylon, has been writing out, regarding the Government Reports which the Republic of the United States issue from its Departments of Agriculture, for the advice and guidance of fruit-growers there. These Reports are extremely practical, and explain how insect pests or fungoid growths—special enemies of the American fruit-growers—can successfully be combated; and for the lazy or unbelieving, there are photographs of "struck" and barren-looking trees which have been uncared for, to compare with other vigorous and cropladen ones which have been regularly sprayed. It is an object lesson which carries conviction, and the fruit-grower if his garden or plantation be a failure, has himself to thank for the want of success. For he is not left as is the cacao, the tea and coconut planter in Ceylon to puzzle out what ought to be done:—*that* has been scientifically worked out for him, and he is directed as the case may be to spray the stricken trees with kerosine, preparations of arsenic, sulphate of copper, with lime and water, &c., &c. The fruit-grower of America knows now that if he neglects the insecticides and fungicides, his time and labour will be wasted, and that spraying at insect or fungoid enemies, must be regarded as a regular and necessary part of a fruit-grower's work. There is nothing new nor wonderful in this: it is as true now as it was when "Adam delved and Eve span" that "in the sweat of thy face" are cacao and fruit, like all other products, to be reaped.

In the Ceylon crusade against the cacao pest, men seem to be all at sixes and sevens. That it is a fungus is the belief of some, while others hold it is a beetle; and as for remedies, the white-wash and tar brushes have been much in evidence, and after that too often comes alas! the saw and the furnace. Cacao culture here is a comparatively small affair as compared with tea or coconuts; but it is an extra string to the bow of the island's prosperity, and is not grown without profit. If the men who are interested in it only knew what to do, there would be a determined effort to do it; but they fight their enemy in the dark, waste their strength in wild blows at nothing—and many are so sick of experiments that they are letting things take their course till the expert promised, has arrived, studied and spoken. Had there been a Department of Agriculture to turn to or even an Entomologist to examine carefully, experiment and then advise, this weary waiting might have been avoided, and less treasure lost. Scientific advisers are the need of the day.

As if to emphasize the lesson sought to be enforced on His Excellency the Governor and his Executive in the foregoing, we have now to direct attention to the instructive letter of Mr. A. Van Der Poorten, in which that accomplished cacao planter gives his experience of enemies of his product. He apologises most unnecessarily for his imperfect expression in a language not his own; but would that all our English cacao planters could tell us as much and as clearly as this Belgian gentleman. The indebtedness of the Ceylon Planting Enterprise in times past to gentlemen who owed their birth to the Continent of Europe, for valuable observations benefitting the community as a whole, is well-recognised and historic. The accomplished compiler of the "Enemies of the Coffee Plant"—long a most useful and standard work—was the late Mr. Nietner of Pundaluoya, a Prussian. The letters of Mr. G. A. Cruwell (Cruvelli) in the *Observer* on coffee planting here and in other lands, added much to our information in times past, and other planters could be mentioned to whom Mr. Van Der Poorten is a most worthy successor. He shows very clearly where and when he should have been glad of the aid of a scientist in trying to understand fully, and to combat the particular enemy of his trees; and we can simply repeat that it must be deemed a lasting disgrace to the Government of Sir Arthur Havelock that it should have refused the Planters' Association the aid of an Entomologist at the time a special appeal for one was made. Now, we have a Governor whose fault—if fault it be—is to act perhaps too impulsively and with a desire to have affairs which require a good deal of consideration and careful inquiry, cleared out of hand right off, in the minimum of time. The Hills

Tramway Commission (with a Chairman and leading unofficial member who only had a few weeks to spare in the island after their appointment is a case in point—and so, to some extent, is the offhand promise of a "specialist for cacao disease" without any proper attempt at defining what he is to do. There is time, however, to have both these slips—failings on the right side, we confess—rectified and good then can only result. We should certainly like Sir West Ridgeway to consider how this great Agricultural Colony can secure a Scientific Staff such as Java, or more than one of the fruit-growing States of America—say California—is favoured with. Would it be considered dreadfully heretical to advise the reduction of our nine Government Agencies into four or five Collectorates, and the devotion of the salaries and allowances so saved, to the establishment of an Agricultural Department and Scientific Staff to deal specially with the enemies to which all our food, fruit or other commercial products, are subject? We have often pressed this view on successive Governors and the longer we live in the island and watch what is being done in India, in Java, in New South Wales and Queensland, and in the United States of America,—the more we feel the necessity for the development of a truly active Agricultural and Planting policy on the part of the Government of Ceylon. How to make two blades of grass grow where only one grew before,—how to increase the fruitfulness of cacao, Liberian coffee, coconuts, &c., by showing how enemies can be fought and got rid of—is, after all, a far more useful service than the devising of better means of collecting revenue, or the watching over land applications, encroachments and sales. Since the abolition of the only semblance of land revenue assessment and collections in Ceylon, what have our nine Government Agents to do of any importance that would not be disposed of by two or three Collectors from Southern India? A thousand worries and trifles affecting Kachcheri routine, do not and ought not to count in such a case.

TOBACCO CULTIVATION IN JAFFNA.

(*Communicated.*)

Tobacco is cultivated in different parts of our Peninsula, mainly in country plots where the soil is most adapted. Though the use of tobacco is strongly condemned by many; yet we find no decrease either in its cultivation or use to any appreciable amount. There can be no doubt that the cultivation of tobacco in Jaffna is steadily advancing as may clearly be known from two facts viz., the fact that extensive tracts of land which were at one time left in a state of chronic uncultivation, unsubjected to the plough or hoe, have now been developed and turned into fruitful tobacco gardens; and the fact that a large quantity of tobacco as well as cigars is sent occasionally from Jaffna to the Metropolis, Galle, Malabar Coasts and other emporiums.

The cultivation of tobacco plants requires as careful study and attention as any others. In tobacco plants there are different kinds, of which the following are well-known to our tobacco planters. *Chonian* (of which there are two species white and black) *Annieathan*, *Thattian* and *Kulayan*. The young plants are obtained from seeds, which are smaller than the mustard seed. They are at first reared in the nursery for about a month and a half Then they are planted in parallel straight lines, care being taken to preserve a distance of a couple cubits between two plants. The time of planting usually begins in November and continues till February. Before planting, the ground should be well manured, ploughed and hoed, the manures used being cowdung, green leaves of plants such as *Karilay Poovarasu* etc. After planting, the next thing to be done is watering. While young the plants should be watered daily; but after they attain a couple of months growth they are watered every other day. The plants then grow up day by day assimilating the manure, the air, and the water and spreading their leaves all round the stem, till they reach the stage of blossoming. At this stage the most essential part that should inevitably be performed in growing tobacco, is topping. It is usually best done by cutting off the heads of the plants beyond a certain limited number of leaves, which vary between 10 and 14. As the result of topping, secondaries will make their appearance at the joints of each leaf. and unless these be carefully pulled off the total amount of money labor and time spent on it would be of no avail. The very object of topping is to make the leaves increase in length breadth and thickness. The task of pulling off the secondaries is as necessary as that of topping. This is done usually thrice until the plants attain their full growth. The rain at this time is unwelcome to the plants, since it washes off the sap and tears away the leaves. A bumper tobacco crop in its state of full development is indeed very pleasant to look at. The signs of full development are some colored marks, or spots on the leaves. The leave are then cut off with a part of the stem and subjected to the manifold processes of curing. It should be noticed that like tea and coffee, paddy and other plants, the tobacco plant is not free from the attacks of disease or worms. The most destructive of the latter are the *Allukanavan* and the *Arrakottian*.

If careful attention is paid to the manuring planting and pruning of the tobacco plants they are sure to grow well and be remunerative.—*Patriot.*

FACTS, FIGURES, AND THEORIES ON THE DECLINE OF CHINESE TEA.

INDIA AND CEYLON AS COMPETITORS. DECAYED TEA PORTS.

(FROM OUR SPECIAL SHANGHAI CORRESPONDENT.)

The history of commerce presents few examples of a national industry having to pass through such an ordeal as the China tea trade is now undergoing. Year by year for the greater part of a generation it has declined, until now it is a mere shadow of its former self. But beyond the fact of the decline we know little either as to its extent or as to its economic effects on the Chinese tea growers. How they have adapted themselves to the disastrous change, or if they have paid any attention to it, is a mystery. Whether or not they have found new markets elsewhere in place of those lost to them in Western Europe is open to dispute. Whether or not they have reduced the tea growing area is a question differently answered by various authorities. All we can make sure of is that the British tea trade with China is rapidly shrinking up.

The present season (1896-97) so far from holding out any hope of improvement exhibits more rapid retrogression than ever. With one solitary exception every port of shipment exhibits a decrease. The exports to Great Britain from the commencement of the season to the middle of January fell from 43,362,000 lb. to 37,336,000 lb. The northern, central, and Southern districts have all the same tale to repeat of reduced demand. The Hankow and Shanghai shipments, which take the lead in quantity, lost nearly three million pounds as compared with the corresponding period of 1895-96, their aggregate to date having been only 18,410,000 lb. against 21,317,000 lb. The central districts shipping by Foochow are more than two million pounds short—12,749,000 lb., against 14,676,000 lb. The Southern districts shipping from Canton and Macao are over one million lb. short—an aggregate to date of 6,317,000 lb., against 7,368,000 lb. on the corresponding period of last season.

So far as concerns our own market these figures only bear out what was already matter of general knowledge. They cause no surprise as some of the other figures do. China was supposed to be finding compensation in America for her losses in Europe, but that turns out to be

A FOND DELUSION.

This season's shipments to the United States and Canada have fallen off to almost as large an extent as those to Great Britain. They aggregate up to the middle of January 49,755,000 lb., or fully 3,000,000 less than the corresponding aggregate of last year, which was 53,128,000 lb. China's final resort is Russia, but here again we encounter a sharp shrinkage—at least in the shipments to Odessa. Their total for the season has so far been only 22,949,000 lb.—fully 4,000,000lbs. less than last year's total of 27,240,000lbs. More tea may have gone overland to Siberia, but that is hardly likely in view of the growing diversion of Russian trade from the overland to the sea route.

The tone of recent official reports on the tea trade is generally speaking, bad. The Imperial Commissioner of Customs at Hankow predicted some time ago that the tea trade with England would decrease year by year, which it has done. He also expressed his belief that if India and Ceylon tea can be produced to suit the Russian taste, the Russian trade will likewise go. The Foochow Commissioner says of his district that in the preceding ten years the tea trade had declined 50 per cent., "chiefly owing to depreciation in quality." Foochow had become a mere bye-port, and its foreign colony had shrunk to a few hundreds; the actual census was 350. The amount of business done by them was no longer half what it had been, and the foreigners employed in the Arsenal and other public institutions had been almost entirely supplanted by natives. The melancholy conclusion he came to was that present indications for the tea industry "are more than discouraging."

Amoy is another of the dried up tea ports from which a voice of lamentation has been raised. In the official review of its Customs the writer observes that "exports have increased or maintained a sound average, with the exception of a serious decline in tea. Careless cultivation and dishonest packing had already killed the Congou trade of Amoy in 1881; now local Oolongs are hardly worth the cost of shipment." Only a demand for low-priced teas kept the market alive at all, and that was being threatened by Japan. As a tea port the principal use of Amoy was the

MARKETING OF FORMOSA TEAS,

which are transhipped there. This Commissioner gives a welcome indication of how the case is regarded by the Chinese themselves. "Strangely enough," he says, "the natives appear to view the ruin of this important trade with absolute indifference, and without moving a finger to retrieve their position."

But for an example of the utter ruin and decay which may overtake a once flourishing port, Whampoa is the place to go to. In the days of the old tea clippers Whampoa was the rendezvous for the annual tea race to London. Situated in a bend of the Pearl river, a few miles below Canton, it was a very convenient place for ships to finish loading at, and equally convenient to start from. They could drop down the river in a few hours and get clear away to sea. They were great days those of the Agamemnon and the other tea clippers racing home, with a £500 bonus waiting for the captain of the first arrival. I steamed past Whampoa lately in the moonlight, and found it a picture of desolation. Not an ocean-going ship lay in its beautiful bay, and hardly a sound was to be heard from the shore. Poor Whampoa looked like a city of the dead.

A good many explanations have been offered of the phlegmatic resignation with which the Chinamen bear what any other people would consider a national disaster. Most of them are conjectural, but one or two have a plausible appearance. It is affirmed that the heavy decline shown in the tea exports is to some extent misleadinn. These returns are made by the Imperial Maritime Customs, and cover only teas shipped in foreign bottoms for foreign account. Teas passing through the native Customs are not included, any record made of them being taken by the native authorities, who keep it to themselves. Recently the native junks have competed strongly with the foreign steamers for tea freights, and have undoubtedly been securing a larger share of them. Part of the decrease shown at inland ports may therefore be only a transfer from one channel of export to another.

Another theory with more substance in it is that it took a long while for much of the loss to reach the tea growers. During the intermediate stage the greater part of it fell on the merchants and the middlemen. This explanation is countenanced by the well-known fact that for years past

TEA EXPORTING HAS BEEN A LOSING BUSINESS.

The trade reports of the native tea markets all agree on that point. In a review of the last Canton season it is said "The result was again disastrous to shippers in spite of the fact that teas were laid down cheaper than ever known before." Teas shipped from Ningpo during the same season were of inferior quality and adulterated as well, the result being that "of the thirty odd native hongs engaged in the Pingsuey tea trade, not more than four or five made any profit at all. The rest are reported to have lost sums varying from 5,000 to 8,000 dollars."

In view of the many interests involved in this tea question, I have taken every opportunity here of making local inquiries regarding it. English shippers at Shanghai and Canton have favoured me with their views, which, as a rule, are decidedly pessimist. One whom I met at Canton had been in the trade over 20 years, and he considered it irrecoverably gone. The competition of India, Ceylon, and Japan was growing too keen for the Chinamen, who would not wake up to it till too late. Others took a more hopeful view, and anticipated a revival not only so, but they thought it might come comparatively soon. So far the new producers have had everything on their side—virgin ground, ample capital, skilled management, and all the best mechanical appliances for curing the tea. The Chinamen, on the other hand, had been handicapped by worn out ground, no capital, little or no technical skill, and no mechanical assistance.

It is by no means out of the question for the Chinese tea growers to retrieve themselves, and turn the tables on their Indian competitors. A first step in that direction is already being taken in some of the tea districts where "firing," that is, drying the leaves by machinery, is being introduced. The drying is done in half the time that the Chinese method of sun-drying required, and at half the cost When plants which have outgrown themselves and become stale are renewed, Chinese tea may recover much of the fine flavour it has lost. More careful sorting and packing, less adulteration, and a return to the straightforward business methods of early days will all help to rehabilitate its damaged credit. The Chinese tea grower is not played out yet any more than the Caucasian is, but it is about time for him to turn over a new tea leaf.—*Dundee Advertiser.*

MR. RHODES AS COFFEE PLANTER.

The rumour that Mr. Rhodes is going to apply his many-sided mind to coffee growing on a colossal scale in the Shire Highlands of Central Africa, is causing a good deal of interest amongst those who are already engaged in the industry in that part of the world. It would be singular if Mr. Rhodes should really return, in the zenith of his fortunes—so far as money-making is concerned—to an occupation which he attempted with scant success at the outset of his colonial career. Long years ago he was a coffee planter in Natal, but discarded the life for the more exciting one of diamond hunting at Kimberley. —*Daily Chronicle*, April 10.

NUWARA ELIYA TEA ESTATES COMPANY, LIMITED.

Report of the directors to be presented to the first annual general meeting of shareholders to be held on Friday, the 30th April, 1897, at the offices of the Agents, Messrs. Frith, Sands & Co., Winchester House, Old Broad Street, London, E.C., at 12 o'clock noon precisely.

The directors beg to submit to the shareholders the balance sheet and profit and loss account up to 31st December, 1896.

The accounts shew a surplus of £9,910 0s 10d from which debenture interest £1,590 is deducted, leaving a balance of £8,320 0s 10d. An interim dividend of 4 per cent. was paid in September, 1896 which absorbed £4,053 6s 8d. The Directors now propose to pay a final dividend, making 6 per cent, for the year, on the four issues of shares from the respective dates that they rank for dividend, viz. :—

		£ s. d.	£ s. d.
Shares Nos.	1— 3,300, from 1st Jan. to 31st Dec., 1896, at 6 per cent per ann.	1,980 0 0	
	Less Interim Dividend paid..	1,320 0 0	660 0 0
,,	3,301—11,500, from 1st Feb. to 31st Dec. 1896, at 6 per cent per ann.	4,510 0 0	
	Less Interim Dividend paid..	2,733 6 8	1,776 13 4
,,	11,501—13,700, from 1st July to 31st Dec. 1896, at 6 per cent per ann.	..	660 0 0
,,	13,701—15,870, from 1st Nov. to 31st Dec. 1896, at 6 per cent per ann.	..	217 0 0
This will absorb ..	..	..	£3,313 13 4

Of the balance, £953 0s 10d, it is proposed to apply £300 to a Sinking Fund against the premium paid for leases, and £653 0s 10d towards the liquidation of the sum of £1,109 2s 1d, the amount of the formation expenses of the Company.

The crop of tea from the Company's estates amounted to 565,692 lb. of which 535,675 lb. was manufactured at the various factories on the properties, and green leaf, representing 31,860 lb. Tea, for which accommodation for manufacture was not available at the time, was sold to a neighbouring estate : 1,843 lb. Tea was also made from purchased leaf. The cost of manufacture and placing on steamer at Colombo was 4·88d per lb. The average exchange for the year was 1s 2¾d., and the average gross sale price of the tea 10·30d. In addition to the tea crop, about 220 bushels of coffee, and 76,340 lb. of Cinchona bark were gathered and sold in Colombo.

The Company acquired at first only the estates of of Park and Concordia ; since then several other properties have been purchased as detail in the accompanying statement of acreage. As shewn in this statement, 2,174 acres are now under tea in various stages, and the estimate for 1897 is for an outturn of about 180 lb. per acre for the area in full bearing, and about 250 lb. from that in partial bearing.

The policy of the directors, which has been ably carried out by the Manager in Ceylon during the past year, has been to effect such alterations and improvements in the general condition of the estates and factories as will ensure the best possible results in the future.

With this view extensions were completed during the year to the factories at Naseby and Park estates, and commenced to those on Pedro and Court Lodge, while entirely new factories, on Portswood and Concordia, are now practically finished. The want of these materially affected the first year's profits.

The General Manager reports that all the estates are now in thorough order, and anticipates much improved results in the current year. This is borne out by telegrams giving figures of yields very largely in excess of those to same date last year.

STATEMENT OF APPROXIMATE ACREAGES REFERRED TO IN THE REPORT.

Estates.	Tea in full bearing.	Partial bearing.	Not in bearing.	Jungle.	Patna Scrub and Waste.	Fuel Trees	Total.
Park ..	161	7	20	—	10	3	201

VARIOUS PLANTING NOTES.

COFFEE IN NEW SOUTH WALES.—A Sydney merchant writes :—"There is a little boom on about trying coffee on some of our Northern rivers' lands—about the Richmond : on the flats they grow maize and sugar, but they have hill lands, too."

THE MOST EXPENSIVE PRODUCT in the world is said to be the charcoal thread which is employed for incandescent lamps. It is chiefly manufactured in Paris. It is sold wholesale by the gramme (15½ grains). In reducing its price to the basis of pounds weight, it is found that the filaments for lamps of twenty candles are worth £1,600 per lb., and that for lamps of thirty candles they are worth £2,400 per lb. The former have a diameter of twenty thousandths of a millimetre (millimetre=0·0394 in.), and the latter four and a half thousandths of a millimetre. The filaments for lamps of three candles are so light that it would require nearly 1,500,000 of them to weigh 1 lb. As the length of each is 10 cm. (3·937 in.), their total length would be 187 miles. —*Egyptian Gazette*, April 9.

CHINA AND JAPAN TEAS.—It will be seen from the following return that 6 million lb. less of China tea have gone to Great Britain in the season now closing than in 1895-6. To Russia—that is Odessa—the decrease is nearly 5¾ million lb. To North America there is a comparative falling-off of nearly 5½ million lb. of China and 5¾ million lb. of Japan teas. The total figures in the China papers are as follows :—

	1896-97 lb.	1895-96 lb.
Export from China to Great Britain ..	37,444,332	43,503,555
Export from China to United States and Canada	50,548,770	55,959,010
Export from China to Odessa	22,919,123	27,240,863
Export from Japan to United States and Canada	42,526,802	48,223,444

Correspondence.

To the Editor.

MANURING OF TEA ESTATES AND MR. JOHN HUGHES' REMARKS.

DEAR SIR,—The net value on the increased tea yield will temporarily drop to one set of factors, but is not touched on another. Cultivation with artificial manures may be a means to one of two ends, bush-making or crop, and to take the latter with no care of the former is but caterpillar policy! A heavy pruning, followed by application of manure previous to a season of a "rush of leaf" will, of course, aggravate the poor liquoring teas primary flushes give. But such drastic measures are to be followed by bush-training and how to "tip back" etc is another tale. Say the cover of tea over area has thus been attained pruning is only necessary at greater intervals of time, your second application of £ s. d. comes on six months after the 2nd pruning and can it be otherwise than that better leaf will be obtained from the improved *wood?* I have had better results from an application costing R5 an acre than where I have spent twice the amount and this is yet another tale.

It is difficult when writing on a subject such as this to refrain from running into other than the immediate factors and these major tactics of agriculture are a cheap enough education when one may read what Messrs. Hughes, Bamber and Cochran have to say and so keep a tea farmer from blundering in his work; and to be versed in a little elementary chemistry and geology facilitates a ready understanding of their writings.

"REPLY MARKED OO."

BHANG AS A FEBRIFUGE.

Colombo, April 27th 1897.

DEAR SIR,—In the *Ceylon Observer* of Saturday (24th inst.) inquiry is made by D.F. (page 2nd "An Olio") from some medical man as to whether "bhang" is used as a febrifuge, and mention is made of what Knox, in his "Historical Relation of the Island of Ceylon," says about it. I have referred to Knox's book and find the statement in the place indicated (page 154). After Knox's escape from Kandy, he proceeded Northwards and had to drink of the water of tanks in the Vanni which he describes graphically—"having no springs, we were fain to drink of ponds of rain water, wherein the cattle lie and tumble, which would be so thick and muddy, that the very filth would hang in our beards when we drank." He goes on to say that he had been accustomed "to drink pure spring water only," but the bad water he was compelled to drink brought on "violent favors and agues." He learned, however, of "an antidote and counter-poison against the filthy venomous water," which is thus described:—"It is only a dry leaf; they call it in *Portuguese, Banga,* beaten to powder with some of the country *jaggory,* and this we eat morning and evening upon an empty stomach. It intoxicates the brain, and makes one giddy, without any other operation by stool or vomit."

A good account of Indian hemp or gunjah may be found in the "Bengal Dispensatory and Pharmacopœia by W. B. O'Shaughnessy, M.D., Professor of Materia Medica in the Medical College, Calcutta," published in 1841. This work was the basis of the "Pharmacopœia of India" by Dr. Edward John Waring, published by the authority of the Government of India, in 1868. The "Pharmacopœia of India" gives the therapeutic uses of Indian hemp, but it is not stated that it is used in fevers. Dr. O'Shaughnessy (afterwards Knighted in acknowledgment of his great services for projecting and carrying out the system of electric telegraphs in India) gives a more detailed account of the medicinal uses of Indian hemp, and states the properties which are assigned to it by Sanscrit, Arabian, and Persian writers and by modern European authors. No mention is made of its use in fevers.

The intoxicating properties of Indian hemp or gunjah were well known, but there was uncertainty as to its medicinal virtues. Dr. O'Shaughnessy made many experiments to ascertain the action of the drug on man and animals, and he gave it to some patients. On one patient, it had the remarkable effect of producing a cataleptic fit. Dr. O'Shaughnessy's investigations satisfied him that it is a useful remedy in some diseases, and his recommendations led to its introduction into European medical practice.—Yours faithfully,

JAMES LOOS, M.D., Retired Colonial Surgeon.

TEA PLUCKING.

May 5th, 1897.

DEAR SIR,—As regards the letters on tea plucking, etc., I should like to know whether it has been ever *proved* that coarse plucking gives a larger yield than good medium.

Take this instance: Mariawatte pluck their famous 100 acres once a week, to get in 4 pluckings a month, and the leaf they get off it by this means is certainly *good medium.* Supposing, however, they changed their system to 10 days plucking, they would only get in 3 rounds instead of 4 in the month, they would get coarse leaf, and *cæteris paribus* would they get a bigger yield at the end of the year than they are doing now? Observe they lose a round a month, and the bushes would get far too high, and I imagine it would be a case of "far too lightly plucked" by the V. A. at the end of the year.

The yield would be bigger for the first 2 or 3 months; but afterwards!!

This must be the opinion of most men or why are they so anxious to have abundant labour?

The answer is because they want to keep well up with the flush, *bully* the bushes, and get their estimates. S.

CACAO CULTIVATION IN CEYLON AND ITS ENEMIES.

Greenwood, Madawellatenne.

DEAR SIR,—I fully agree with your forcible article on "The Cacao Pest" (see page 801) I must, however, take personal exception to your remark:—"The press, which ought to have been supplied with the information, was singularly free from any comment, etc."—As far back as July 28th, 1890, you published a letter from me under the "nom de plume" *Eldorado,* mentioning the first cacao disease, about which even a greater reticence was observed, and which was never investigated by a scientist, but which I had good reason to put down to a root Mycelium and not to Helopeltis which was often absent in fields badly attacked. This disease

which I have shown to have been the cause of the abandonment of *one-third* of the then cultivated area and which had such a fatal influence on crops, virtually disappeared in this district since 1893. It is in January 1892 that I noticed here the first serious attack of about 30 trees in a lump, by an insect which I then identified as "Tomici Perforans"—with apologies to Mr. Barber for my audacity to still use what, to his ears, is a "sonorous, aristocratic name, to make it look learned."—Before, the attack was sporadic and seldom fatal; but this time these trees, which were among the best in my garden, vigorous and healthy, of 12 years of age, growing in deep alluvial soil, fairly shaded, nearly all succumbed. *Criollos* they were, but since then among the large yearly increase of trees attacked, there was the same proportion of hybrids and many Forasteros.

In his interesting and sarcastic letter which appeared in your issue of 12th inst., Mr. Barber pleads the case of "Tommy" as he prefers to call the beetle.

He has evidently read "The Agricultural Pests of India" by Surg.-Gen. E. Balfour and assimilates the information therein contained : "*Tomici.*—The species of the genera Hylesinus, Scolytus and Tomicus are small beetles, but numerous and common. Tomici chiefly affect bamboos and are very destructive to them. The Hylesini also attack the bamboo, but not so vigorously as their smaller brethren, the Tomici, and both are detected by the powdery excremented matter which they and their larvae throw out. One small species of Hylesinus in great numbers attacks the dead wood of the cheer pine, and when hatched underneath the bark, they bore in all directions, the tendency, however, being to reach the centre of the log. They do not attack living trees nor logs that have had their bark stripped off. Tomicus perforans monographus, in 1860, attacked the beer barrels in the Commissariat stores of Burma and Lower Bengal, and the contents oozed out from a multitude of pores, causing great loss. The soldiers gave the insect an apt name—they called it Tippling *Tommy.*"

I have had a similar experience here in 1882 with two hogsheads of wine stored in a locked place. After two weeks I found one empty, and of the other, ¼ had oozed out through a great many drillings made by Tommy. I now cowdung he wood on arrival.

Mr. B. writes that "the question at issue will be whether Tommy has of a sudden changed his natural instinct in the matter of his diet from decaying bark and wood *to fresh, green, sappy plants*," etc. It is clear that Mr. B.'s multifarious occupations have not allowed him to investigate the case with his usual acumen, for he would have found that his client Tommy not only attacks cacao trees, without visible tare, but also the very sappy Dadap tree.

He further states :—"When the planter first notices the *weevil* (sic) he also notices the fact that the tree has changed its condition and *per saltem* he arrives at the conclusion that "an enemy (Tomicus) hath done this thing." Well, if not Tomicus, find the enemy! He exists, for it cannot be supposed that under 20 years of age the cacao tree should be decrepit here when it only attains majority at that age in other countries.

From his above statement I infer that it may be new to Mr. B. that a metamorphosis does precede the appearance of the beetle. It is the grub, which issues from the microscopic egg deposited in the bark, which does the greatest damage. It is only when the grub is at work in the wood that its presence is disclosed. How much time the grub is at work I leave to the scientist to discover. To my knowledge, planters have given up the hope to find a remedy, because having applied some, they found soon that the disease broke out under the application; but this was no proof of its inefficacy for the eggs had been laid or had hatched at the time of the application or even the grub had begun drilling. The trials of the supposed prophylactic remedies must be made therefore in a very methodic way.

I have remarked that the beetles born in the trees are of a very different appearance to those which tunnel the branches (the latter being the same as the Tippling Tommy) but their greater sturdiness might be due to development.

As to Mr. Barber's view "*that the insect is not the cause of death to the plant, but one of the consequences* of it" (the italics are his), I maintain that the insect being always present before, at and after decease of the victim, the circumstantial evidence points to him as being the murderer if no other cause of death can be brought forward. And would Mr. B. acquit the man who would plead that the victim he slew was decrepit?

I join issue with Tomicus's champion in asking for light, practical light, and scientific light, but the latter cannot be given in the form of a diagnosis but only after a serious and long study by a trained entomologist. I do certainly think that Mr. Green would be *the man.*

The damage done is already very large on many plantations and the increase has no check. In this district (Kurunegala), I know several places where tea, Liberian coffee and coconuts are being planted in view of a complete destruction of the cacao.

Craving your indulgence for my ungrammatical English.—I am, dear sir, yours truly,

A. VAN DER POORTEN.

THE COCONUT PALM IN THE GODAVARI (KISTNA) DISTRICT.

SIR,—About the period that you discovered that the first of my Christian names was not Ananias after I had been rem rking that Godavari coconut trees produced 200, 300, and rarely 500 nuts per tree per annum, surprise was expressed that the *small inferior nut* should be planted at all in this part of the world. Could you kindly tell me in what way, though smaller, this nut is inferior; as local tradition has it that the smaller nut is more flavoursome, and the only quality in favour of the larger nut is the far larger quantity of juice (milk). I should like to know what is the Ceylon market value of the large nut, for it seems to me that, if only 70 large nuts can be grown per nnum against 300 small nuts, unless the large nut has more than four times the market value of the mall nut, the smaller one is more profitable. I have said four times, but probably it should be six or seven times owing to the larger extent of land occupied by the greater number of trees to produce an equal number of nuts, not to speak of the nurture of a greater number of trees.—I am, dear sir, yours faithfully,

A. N. LUSHINGTON (Kistna District.)

[Ceylon coconuts this year have mostly run about R30 per thousand—what are Mr. Lushington's prices? But is it not the case that in speaking of 200 nuts and upwards per tree per annum, apart from the smaller size, Mr. Lushing-

ton's experience is of a few trees—and not even a few acres each with 80 trees per acre? In Ceylon we can show wonderful results from a few trees or small gardens, but our statistics are based on plantations of from 100 up to 500 acres each.—ED. *T.A.*]

OUR AMERICAN TEA COMMISSIONER AND HIS GOOD WORK.

New York, April 1.

DEAR SIR,—I send you a copy of the report prepared by experts for the new tea standards here. Dust and Fannings are to have a bad time. I also enclose a few of our advertisements for this week.

I note that in his speech at the Planters' meeting, Mr. Sackville said "*Canada has for many years been receiving funds from the Thirty Committee and its predecessor the Tea Fund.*" is this correct? Many years? Did the *Tea Fund* give anything for Canada? The *Committee* did not begin subscribing till late *in 1895.*—Yours truly, WM. MACKENZIE.

P.S.—Fear of a duty may partly account for the increase. Be that as it may, Sheppard's tea circular gives the following figures:—

Direct shipments to North America from London of Ceylon and Indian teas.

Jan. and Feb.	1896	...	262,000 lb.
,, ,,	1897	...	1,202,000 lb.

Your papers show now a large *direct shipment* increase from Colombo.

[The report on the new tea standards will be found in another column. The advertisements are of the usual attractive character, one being from the "Youth's Companion" regarding which our Commissioner remarks that it is the "second dearest paper in America, the "Lady's Home Journal" being the first. This advertisement costs about £48 an issue in this paper. Nearly all homes take those papers. As to the direct shipments of tea from Colombo the last table of exports and distribution issued by the Chamber of Commerce shows that the export to America this year up to 27th April was 213,201 lb. as against 90,907 lb. in 1896.—ED. *T.A.*]

"ROSES—ROSES—ALL THE WAY."

Upcountry, 15th May.

DEAR, SIR,—That letter on Rose Culture by "Practical Horticulturist" is most interesting and ought to be of great use to all amateur rose-growers. There are acres and acres of abandoned land that might be turned into rose gardens, and gallons of perfume might be distilled therefrom; all we want is some capitalist to take the initiative in planting acres of roses, and then get an expert to show us how to extract the valuable attar of roses. The climate of Ceylon is so diversified that the resources of the island as to New Products are endless; in favoured spots plums of sorts, figs, raisin, vines &c. might be grown most profitably.—Truly yours,

UPCOUNTRY.

PLUCKING TEA IN APRIL: A GOOD THING BUT REQUIRING MORE COOLIES? !

DEAR SIR,—To continue my letter of the 5th inst., I am convinced that were all estates to have sufficient labour to keep the bushes closely plucked in April and May, the result would be that the Ceylon output would be 15 to 20 per cent higher than it is at present, so perhaps it is as well we can't get sufficient coolies though the quality would be better if it could be manufactured. Again had we sufficient labour in those 2 months, what would we do with the coolies in the non-flushing months?

It is in April and May that the cry is for coolies; in most other months there is an over-sufficiency. Now there is a well-known estate that has solved its labour difficulty. It prunes the *whole* of the tea in February, March and April; there is therefore no work in April, and the tea comes into bearing from June onwards, when better prices prevail, and they have an even output throughout the year, Surely that is solving the difficulty!

All estates (below 1,200 ft. where they mostly prune once a year) might not care to do this, though it seems a sane idea, but at any rate men ought to try and get a *minimum* of their tea in full bearing in April, and not prune so much in July and August so as to get a *maximum* of tea in bearing in April which they can't possibly pluck or manufacture properly. Some men lose about 30 per cent of their yield by this means, they leave so much on the bushes, that the tea has to be pruned before it would flush again. So they go on year after year, crying out for labour in April, and wanting to lend coolies half the other months.—Yours faithfully, S.

P.S.—Once a bush gets out of hand it is *doomed*, and has to be pruned, it will give fine results for a few weeks, then comes the "banjy" and then the knife. Besides a man who builds a factory for say 100,000 lb. of tea doesn't supply machinery and withering accommodation for say 35,000 in 2 months.—S.

TEA PLUCKING IN APRIL: A COUNTERBLAST.

May 17.

SIR,—In your issue of 11th instant there is a letter signed "S." on the subject of "Plucking tea in April.

Half the output of Ceylon is produced at an elevation of 4,000 ft. or upwards where rushes of leaf are so very exceptional that there is little or no difficulty in securing the whole lot!

That the other half of Ceylon could turn out an extra 30 or 40 million lb. annually I don't believe, but even were this possible, I think it a wise dispensation of Providence that the labour question steps in to save those lowcountry men from ruining themselves and their bushes by such awful overproduction. Were all estates to follow the advice of "S." and have no work whatever during April (as per that well-known estate which is evidently managed by a man smart enough to take advantage of his neighbour's idiosyncrasies and doubtless makes them pay through the nose for his labour during that month) we should be in a nice fix, as though Ramasamy can appreciate taking it easy as much as any one, he'd look somewhat askance when told he'd have a month's holiday at his own expense and that there really was no pay whatever for April in Ceylon as by "S." established.

The idea of pruning the whole of an estate either below or above 1,200 ft. all at once is a most insane idea; but I know there are men, or machines, who believe in and do this. The result is 3 days' work a week for months and then 7 days a week are not sufficient for the rest of the year. At one time the tea is simply rubbish and at another far above anything it ever fetches and yet we are told this is the way to maintain an even outturn throughout the year!

Distribute your pruning throughout the year both in the low and upcountry; send your advances to the Coast and covet neither your neighbour's ox nor ass and if I mistake not you'll sleep the sleep of the just and earn a decent dividend.—Yours faithfully, FARMER.

THE LABOUR QUESTION.

CEYLON PLANTING DISTRICTS—"AFTER EIGHT YEARS."

SIR,—It is long since I wrote you, but I wish to say another word or two about the LABOUR MATTER. Commenting on my last letter you say "Whenever coolies are very scarce—at a high premium—the Law and the Law Courts go wrong somehow in the planters' estimation." That may be. But at the present time *I absolutely deny that there is any scarcity of labour in Ceylon.* It may be that the Government is short of coolies. The disgraceful state of the main roads in the planting districts points directly to this conclusion. But the planters are certainly not shorthanded. I have been travelling constantly for two months, and I have not seen a single estate weedy—nor have I heard of flush being lost, but I have seen ravines being cleaned, and roads being titivated. True, it is the dry season when weeds are not in evidence; but, dry or wet, these are not works that would be carried on if labour was scarce. As to the "Law and the Law Courts going wrong" they went so very wrong under the presidency of the Ilbert Judge* that we got the Penal Code which was supposed to put everything so very plainly, that the punishment so exactly fitted the crime, as to make it impossible for the veriest tyro of a Police Magistrate to make an error. The Penal Code is still in force, is it not? And still a cooly has but to appeal to secure a reversal of a well-deserved sentence. Scarcity of labour is a very good cry for those—and there are always some—who cannot get coolies, but as a matter of fact it is all *mon œil et mademoiselle Elise Martin*! A kink in the judicial brain accounts largely for the trouble, as it did in the time of the Ilbert bill, when labour was certainly not scarce.

That coolies are *unsettled* all over the country, and that "advances" have gone up to scandalous figures, is only too true, but many causes contribute to this state of affairs. Among others I would mention creepers, conductors, tea-makers, the operations of a certain large firm, and, not least of all, want of loyal co-operation among the planters themselves. I was much struck at the isolated sort of way in which neighbouring men were working, and talking to an old friend on the matter I was reminding him how in '78 and '79, after the famine, when the chetties were trying to keep up the price of rice, we all combined, and each District Association fixed the price from month to month until rice fell to its normal figure. "Those days are past," he said, "there's no cohesion and no cooperation among planters nowadays. It's each for himself and the devil take the hindmost." "But surely the P. A. could regulate to some extent the rate of advances?" "No good, old man; no good. The P. A. is only a talking shop." Ichabod! I thought; and was sad.

I have not come into contact with the creeper; but what I have read about him has made me feel towards him much as Mr. Potter of Texas felt towards Dukes and Dudes. However, whatever his personality, the fact of his position being an irresponsible one is quite sufficient for a kangany to make capital out of and turn to his own advantage. It appears to me, too, that planters as a rule—of course there are exceptions—are not in touch with their kanganies as they used to be, and that far more is left to the conductor and the tea-maker than was in years gone by. I was very much astonished at the advance in the position of these two servants of the estate since my day. And to my mind this largely accounts for the "tricky and cheating disposition which is spreading among kanganies and coolies." These words I quote from a recent *Observer*; of course Ramasamy will get the better of his master if he can in fair fight: but I submit that as a rule he is not, or *was* not, of a "tricky and cheating disposition." This he gets from the conductor and the tea-maker. These gentry read the newspapers, discuss them with the kanganies and concoct schemes for raising advances, sharing the spoil between them. Emissaries from—say Balangoda—who are sent on the crimp, as often as not work through the tea-maker who, needless to say, is not any poorer by the transaction; of this I am well assured. Other kanganies who are not asnxiou to leave a comfortable district for the hardships of new clearing work feel, nevertheless, that they are left out in the cold in the matter of advances, and I know of one district where many head kanganies are banded together in a sort of union to force up advances. An old planter the other day told me that he knew that thousands and thousands of rupees given out as "Coast advances" went only to enrich local boutique-keepers. It is a thousand pities that some big head kangany can't be "jugged" for obtaining money under false pretences; but to hope for such things is like crying for the moon. In view of the free credit given to kanganies, of the absolute lack of security in the matter of Coast advances, and of the fact that no interest is charged on such loans, the planter is entitled to special protection in such cases as the following which I quote from the *Observer* of 31st March: "A kangany interviews a planter about bringing him a gang of coolies; but first their debts must be paid, these debts consist say of R1,000 to the estate they were on, and R1,000 of outside boutique and chetty debts. "*The latter must be paid and the money is wanted for them*; but inasmuch as the estate Superintendent refused a tundu, he, the kangani, having given proper notice, does not mean to pay the R1,000 due to the estate—but will let the owner whistle for it!" *Possibly* the Superintendent committed an error of judgment in refusing the "tundu." *Certainly* the kangani deliberately contemplated a crime (*morally*) in evading his debt, though *legally* he was only approachable by civil action. It would be interesting to know how long that R1,000 had been outstanding without interest: also how much the kangani had made in re-lending it. I remember a case coming before me once in which one cooly had a claim against another for an incredible sum. All the kanganies were witnesses and thought it unjust that the defendant should appeal to master. I found that the poor wretch had paid his debt over and over and over again: but it had originally been out standing for three months and the interest had been agreed on at the rate of 50 cents. per rupee per month, or 600 per cent per annum!!!

* No—Mr. Ilbert was not a Judge, but legal member of the Viceroy's Council, and it was the "Ilbert bill" that made him known.—ED. *T.A.*

Of course I ruled that the debt had been paid; but my decision, though acquiesced in, was considered by the kanganies as hard lines on the usurer! One of the most successful head kanganies I ever knew charged his coolies 15 per cent per annum on their debts, and kept his books perfectly.

In the *Ceylon Observer* of 2nd April you have a column headed

"COOLIES—COOLIES—COOLIES."

When things arrive at such a pitch, surely the P. A. can—and should—take the matter up and legislate for itself and its members at all events. In 1879 it reduced wages and head money all over the country,—why not tackle advances in 1897?

"Every member of this Association pledges himself to reduce his outstanding advances as speedily as possible, and in future never to have on his books advances at a higher rate than R20 per head of his total labour force." I maintain that this is quite feasible. Let "Jack Campbell" thus signalise his *first* year of office and earn the gratitude of his brother planters.

WILD MAN OF THE WOODS.

THE TREATMENT OF RAMIE OR RHEA FIBRE.

(To the Editor of the *British Trade Journal.*)

SIR,—I am exceedingly pleased to gather from F. C. T.'s letter, dated Foochow, December 18th, 1896, that the Ramie-growing district of China is likely to be opened up. China is a grand field for ramie, rhea, or China grass culture. We should be pleased to open up with any capitalists willing to start a plant in China. We should recommend the degumming process to be carried on whilst the ribbons are yet moist. We are willing to provide decorticating machinery, degumming plant, and teach our process of filassing to a substantial company, and take our payment in shares.

We could supply our patent machinery in any quantity, and would undertake to act as brokers or contract for the material. There are many advantages in filassing on the estate before the gum has time to harden:—(1) It is much easier to do; (2) The quality of the fibre is better; (3) There is a great saving in freight.

We shall be glad to hear from F. C. T.—Your faithfully, EDWARDS RADCLYFFE.
(The Ramie Syndicate, Ltd.)

(To the Editor of the *British Trade Journal.*)

SIR,—I have worked for years at rhea. I have spent therein thousands of pounds. My work and my money have brought me the clear conviction that if a machine is used to treat rhea, the result is a damaged article. If chemicals of any kind are used, the result is equally fatal. The time within which the damage will declare itself is uncertain, but it is latent, and will become active. Therefore, I have adhered to my system of hand-labour, and of excluding the use of any acid or caustic, relying for my solvent on water only, used according to my patent process, as described in paper enclosed.

Thus only can the cultivation of rhea be carried out by small proprietors so as to give them a crop which will be more remunerative than any other. The decortication of rhea is specially suited to small cultivators, because women and children do this work better than any machine, because by hand-labour the whole of the fibre is obtained, and nevertheless the cost is *less* than that of any machine I know of. My subsequent treatment is of the simplest kind, and should be compared with the skilled labour, the chemical knowledge and manifold displacements required by processes involving the necessity for expensive plant and experts to control it.

I write with confidence respecting decortication, as a company of which I was one of the largest shareholders imported from China hundreds of tons of rhea ribbon decorticated by the use of water only (in the form of condensed steam), and they arrived perfect in quality, and with every particle of fibre left intact.—Yours, &c, EDWARD CASPER.

PLANTING NOTES.

MR. JAS. A. GAMMIE of Mungpoo, Darjiling, who did so much in the early days of the cinchona enterprise in promoting cultivation and in the manufacture of the alkaloids for the Indian Government, is about to leave India.

CENTRAL TRAVANCORE: PEERMAAD, 9th May. —*Weather.*—Rainfall for April, 4·25. Rainfall for year to date, 10·50. *Crops.*—Tea flushing hard. Every available cooly on plucking. *General Health.*—Good. *Labour.*—Somewhat short.—*Planting Opinion*, May 15.

THE RHEA FIBRE TREATMENT CO. has appointed Messrs. A. Whitly & Co. Sole Agents in Ceylon for the purpose of purchasing any rhea ribbons that may come into the market. We hope there will soon be an appreciable supply. Ceylon can grow any quantity of rhea or ramie.

COFFEE IN BRAZIL.—A statement has been for some time current—says the latest *Rio* paper—that another important coffee plantation in São Paulo has been sold to foreigners, the price mentioned being £200,000. As the reports are contradictory, we have been waiting for details and names, but thus far without success.

RAMIE.—Mr. Barraclough in his lecture on "Ramie" at the Society of Arts, tried hard to steer clear of controversial matter; but—says the London correspondent of *The Indian Engineer*—in the discussion that followed, the advocates of the various systems went at it hammer-and-tongs, and were only stopped by the merciful time limit, or they would have been still going at it now.

COFFEE PLANTING PROGRESS IN SUMATRA.—Our correspondent writes:—"Here (district Serdang) all are busy planting. Two years ago there were 3 coffee estates in the district. Today there are 23 and land is hardly to be got. There is a Coffee Planters' Association, one of whose rules is a fine for non-attendance unless a proxy or excuse for absence is sent!"

COCOA AND THE BROKERS.—Some weeks ago we had occasion to point out how the price of coffee, among other products, could be sensibly raised by direct sale to the large grocers, instead of through the usual channel of public auction. This is what the *Produce World* says on the matter as regards cocoa:—"In proof of what we have written in previous numbers that there surely remains yet something to be done in the matter of bringing the planter and consumer more directly into touch with one another, it may be noted that a company has lately started with the idea of selling to the consumer at the lowest possible prices, reports that they have been successful in placing among other article cocoa at the rate of 84s to 85s per cwt. of identically the same quality as that which has been offered and sold at the public auctions in Mincing Lane at as low a figure as 50s. Undoubtedly there are many difficulties the company referred to will have to encounter before they are able to get this method of trading into an easy style of working. It nevertheless shows quite clearly that the middlemen are to a very great extent to be dispensed with entirely, and we beg to tender our heartiest congratulations to the Company in question on their new method of sale.—*Planting Opinion*, May 15.

Italian Coral.—The coral industry, which is of considerable importance in Italy, from the maritime point of view, also employs both capital and labour for working up the raw material procured by the fishermen. Leghorn and Naples, and particularly the former, are the great centres of the coral-working industry. There are no complicated processes, it being only necessary to select from the rough material the better qualities according to colour, and the better portions of such qualities, and to form them into beads of various shapes to suit different markets. The work is almost entirely done by girls, who saw, turn, file and polish the raw material. Prices vary greatly according to the shades of colour and to the size of bead of uniform shade which can be produced. "Of late years the average price has fallen considerably," says Mr. FitzGerald Law, Commercial Attaché, "owing to the increased production of what are considered inferior qualities, but the price of the best-coloured coral remains very high, reaching exceptionally to as much as £12 per ounce." The exports of coral, rough and worked, amounted in 1895 to somewhat over £1,000,000 sterling. About 60 per cent. of the exportation is to British India, and the demand for the African market is said to be most promising for the future.—*Journal of the Society of Arts*, April 9.

Agriculture and Planting in Brazil.—One of the most elaborately prepared volumes that reach us year by year, is a bulky paper-covered quarto (about 500 pages) from San Paulo, entitled this time :—

Relatorio Annual do Instituto Acronomico do Estado de S. Paulo (Brazil) em Campinas 1894 e 1895 Volume VII. e VIII. Publicado Pelo Director Dr. Phil. F. W. Dafert M.A., Com a collaboracao dos Snrs. F. M. Draenert e L. Rivinius e dos Membros do Instituto, San Paulo, Brazil.

The index shows—apart from Administration—chapters on Agricultural Chemistry ; experiments with Coffee (accompanied by a series of engravings of the bush) ; Viticulture ; Veterinary ; Hygiene ; Commercial and Industrial ; Meteorology ; Rural Economy, &c. The statistics are very elaborate : the letter press is all in Portuguese. There is a great deal about coffee and sugar preparing machinery with detailed illustrations. The whole reflects great credit on the Brazilian, or San Paulo, authorities and their officers.

Liberian Coffee.—The production and export of Liberian coffee is becoming a subject of great concern to the farmers of the Republic. The phenomenal increase in its production is worthy of consideration. The coffee exported during the fiscal year, 1896, amounted to 600,000 pounds, while the exports for the year ended June 30th, 1896, amounted to 3,000,000 pounds. Farmers, merchants, and people generally have turned their attention to coffee growing. While no American ships touch at any Liberian port, yet more than one-fifteenth of the coffee produced is shipped to the United States *viâ* Liverpool. Coffee is the largest export, yet palm oil, palm kernels, piassava, and rubber are shipped in great quantities. It is asserted that if ships from the United States touched at Monrovia, Bassa, and Cape Palmas, half of the imports would be American, and, in turn, the exports would go to the United States, as the people, with the exception of the few Europeans residing in Liberia, prefer American produce. The reason for this preference is that the people are immigrants from the United States, and in habit and life are American. It is stated that a direct line of steamers from New York or Boston, touching at Monrovia once in two months, would be a paying enterprise.—*Journal of the Society of Arts.*

Plucking and Pruning of Tea."—An old "V. A." writes to us :—

"To show you the depravity of planting human nature I may tell you that I meet planters who believe that the letters you have published on Manuring and Plucking and Pruning tea are mostly manufactured on the premises—as there is so much they don't appreciate in them! The bulk of the creeper and assistant-dom of the present day is far more interested in the district tennis and golf tournaments than discussions of subjects they are paid to become masters of."

We are obliged to our friend and fully empower him to refer any sceptic to a visit to our office where the MSS. of the 150 to 170 letters printed can be produced for his benefit. But planters who do not care much for their work or its improvement, are just those who are most likely to cavil on any excuse, however forced. Here, however, is what Mr. John Hughes of Mark Lane—one of the most competent authorities—writes to us by last mail :—

"Plucking and Pruning discussion is of real interest and has a genuine ring about it. Have written a letter to London Ceylon Association Tea Committee drawing special attention to the matter."

Forage Plants.—In the Report on Natal Botanic Gardens for the year 1896, by J. Medley Wood, A.L.S., Curator, which has just reached us, we find several interesting paragraphs :—

Mr. F. Lamson Scribner, the United States Agrostologist, says;—

" I send you by mail today a small sample of seed of one of our native forage plants *Atriplex canescens*, James, locally known as 'Shad Scale,' 'White Sage,' or 'Sweet Sage.' It was formerly one of the chief reliances of the cattle men on the arid plains from Western Texas to Arizona, but has now become almost extinct, occurring only on steep cliffs and in protected situations where cattle and sheep cannot reach it." This plant will have a fair trial here and will be noticed in a future report.

Desmodium tortuosum, "Florida Beggar Weed."—In September I received from the same gentleman a packet of seed of this plant about which he says that it is "A wild forage plant highly esteemed in the subtropical portion of the United States. It produces a fodder of fine quality in large quantities, and grows best on sandy soils containing lime. On cultivated lands it grows often 8 to 10 feet high. The haulms, though woody, are eaten by cattle and working stock of all kinds. Beggar Weed makes an excellent green manure. In Florida it is extensively used as a renewer of worn lands. It promises to be a plant of much agricultural value in the warmer countries." This seed was sown at once on receipt, and the plants are now from 12 to 15 inches high, and growing vigorously, seed will most likely be obtained from it for distribution, and I quite expect to be again told that "cattle will not eat it," but farmers must surely understand that cattle require a little management before they will take to a plant so different from their ordinary food plants as these are, but a little care and trouble will soon overcome the difficulty, as I know from personal experience.

Mr. Nock of Hakgalla gives his opinion of the plant for Ceylon, in a letter as follows:—

"The paragraph about 'Florida deggar weed' is interesting. I have a few seedlings planted here for trial, which have only just been planted out ; but one should soon be able to see if it is likely to suit Ceylon."

DEAFNESS. An essay describing a really genuine Cure for Deafness Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, Victoria Chambers, 19, Southampton Buildings, Holborn, London.

COLOMBO PRICE CURRENT.

THE

AGRICULTURAL MAGAZINE,

COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for June :—

Vol. VIII.] JUNE, 1897. [No. 12.

SEASON REPORTS FOR APRIL.

WESTERN PROVINCE.—Paddy. The usual preparation for Yala has in some villages been delayed in the Colombo district; preparations in progress in Negombo district; in Kalutara district, sowing over, except in Rayigam Korale, where it is going on, and with the favourable weather the plants are looking well. A good harvest may be looked for in the Western Province. Rain fell in most parts during the month. Vegetable supply good in Colombo and Rayigam Korale, but bad in Negombo and the Pasdum Korale. Fruits generally scarce except in the Rayigam Korale.

Central Province.—Paddy in various early stages, crop prospects considered good, but it is too soon to form an opinion. Rainfall sufficient: in Matale 9·09 in. registered.

Northern Province.—Paddy. Kalapokam 1897, paddy being threshed. Moderate amount of rain; in Jaffna 1·04 in. registered, in Mannar 2·71 in. Cutting and curing of tobacco going on in Jaffna and Mannar. Prospects of tobacco in Mullaittivu not so good as last year, owing to damage by previous rains.

Southern Province.—Paddy. Yala cultivation in progress. Rainfall plentiful, in Galle 13·77 in. registered. Fruit and vegetable supply good in Galle district but poor in Hambantota.

Eastern Province.—Paddy. Great damage caused by floods. 3,000 acres of ripe paddy under water in South Batticaloa. Sowing of about 5,000 delayed and 600 bushels paddy prepared for sowing will not be fit for the purpose, so that fresh seed paddy will have to be prepared. Cattle murrain decreasing in North Batticaloa. Damage in Trincomalee comparatively little, but there has been an outbreak of cattle murrain which, however, is reported to be on the decrease.

North-Western Province.—Paddy. Maha harvest nearly over and preparations going on for Yala. Rainfall good, and health of cattle satisfactory.

North-Central Province.—Paddy. Yala cultivation commenced in most parts; rain plentiful and tanks well supplied. Rainfall at Anuradhapura 7·13 in. A few occasional cases of murrain in Kalagam Pattu and Tamankaduwa.

Uva Province.—Paddy. Sowing for Maha almost over. Rainfall 10.2 in Badulla. The crop of Indian corn is fair.

Sabaragamuwa Province.—Paddy. Maha harvest almost over and Yala cultivation being taken up. Prospects are satisfactory. In Ambanpitiya in the Kegalle district the rainfall registered was 21·14 in., and in Ruwanwella 11·89 in.

RAINFALL TAKEN AT THE SCHOOL OF AGRICULTURE DURING THE MONTH OF MAY, 1897.

Greatest amount of rainfall in any 24 hours on the 2nd Sunday inches 2·55.

Recorded by A. R. JEREMIAH.

KAFFIR CORN.

The above is the name by which Sorghum vulgare is known in South Africa. In the United States it is called broom corn (compare the Sinhalese name "Edal" iringu), in the West Indies Guinea corn, in India as Juar or Jowari and Cholum. Kaffir corn has the advantage over other cereals of thriving and giving large crops in hot arid regions. In Syria, North Africa, and the Soudan, where it is called *Dhurra*, it is the chief sustenance of the people, and is also considered a necessary diet for horses. In addition to its valuable use as a food, a kind of beer is made in Africa from the malted grain, and the leaves and young stems form excellent fodder for animals, whilst the stalks are sometimes used for manufacturing sugar. The flour of the seeds is very white and makes good bread, and the panicles, after the removal of the seed, becomes hard and rigid, and are used extensively in America and even England, for the manufacture of brooms and clothes brushes. Numerous varieties of the plant are now cultivated extensively in all the warmer regions of the earth under various names.

Sorghum will grow and yield a crop in nearly every soil, but the most suitable is a rich light sandy loam, well drained and not too moist. The climate should be a dry one, and to obtain large crops the temperature should never fall below 60° F. Kaffir corn stands drought remarkably well, so that the hot and dry districts are well adapted to its growth.

The land having been ploughed and harrowed so as to bring it to a good tilth, the seed is sown in furrows, or drilled in by the means of one of the useful seed drills now made by the manufacturers of agricultural implements. The lines or furrows for the seed should be from three-and-a-half to four feet apart, and the plants should be thinned out after they have sprouted, so that the seedlings may not be less than twelve inches apart in the rows. As soon as the corn is a few inches high, the field must be thoroughly weeded, and a second weeding may be necessary later on, or a light plough or cultivator may be run between the rows so as to turn up the soil and destroy the weeds. Very soon the plants will cover the land by their luxuriant foliage which grows with such rapidity. The best season for sowing is June, and crops may be reaped in four or five months afterwards; although when grown under favourable conditions, returns have been got in three months. When the corn has arrived at maturity, it is harvested by cutting off the ears near the top of the stem and then carrying them in baskets to the house or shed. The ears are kept in heaps for a few days, and afterwards they are spread on the floor of the building, and the grain is threshed out by means of a fail. In some parts of the East, Sorghum, like rice, is threshed by bullocks being made to tread on it, and this process dates far back into primitive times. Indeed, in some Eastern countries, agricultural systems and manufacturing processes have been handed down unchanged from remote ages to modern times; descriptions by ancient writers of the every-day life of the people being in some instances faithful delineations of what is seen at the present time.

The crop of Kaffir corn from an acre of land varies considerably fifty bushels, however, may be considered as a good average return. But double that quantity is by no means an unusual crop on good soil.

OCCASIONAL NOTES.

The present month will witness the 60th anniversary of the reign of Her Gracious Majesty the Queen, who through her wise policy and even by her noble example has done much to encourage and advance the peaceful art of agriculture. It was during Her Majesty's regin that Agricultural Colleges were founded, and we would fain hope that this "Jubilee year" will see the adoption of a liberal policy (too long delayed) for agricultural education in this Colony.

The present number brings the 8th volume of the Agricultural Magazine to a close, and we again thank our subscribers for their kind support and the press for its patronage.

With this issue we forward to those of our subscribers who we venture to think take a special interest in the School of Agriculture, copies of "Addresses on Agricultural Education in Ceylon," being a reprint from the *Ceylon Observer* of the Prize-day Speeches delivered at the School of Agriculture, Colombo, since the founding of the institution.

Our correspondent "Traveller" is doing good service to the school in contributing a series of Notes in which he declares his intention of reviewing the past work of the institution. We trust his contributions will serve the desired end, to place fact in their proper light.

Dr. Henning's instructions how to inoculate for rinderpest are most welcome, and are clear enough to encourage some of our enterprising stock-owners to operate on their own cattle.

THE SLAUGHTER OF CATTLE.

The *Australian Tropiculturist and Stockbreeder* is publishing a series of prize-essays on this subject which is of more than ordinary interest to us, and we therefore take over from the valuable pages of the paper referred to the following essay by W. J. Evans, who writes briefly and to the point:—

To deal fully with this subject it is well to describe the treatment to which cattle are subjected previous to slaughtering. To preserve the good colour and keeping qualities of the meat it is necessary that all cattle, whether very fat or not, should be given rest for at least an hour in some place or shed near to the slaughter-house. Food should be withheld from them for the same period, but in no case longer than three hours. Water should, for drinking purposes, be always plentifully provided. The quality of a carcase is greatly reduced if the animal is slaughtered in a heated condition; the fat, when cold, appears of a bloody hue, caused by the presence of a quantity

of blood, which should be absent; and as blood is the first thing to become putrid the necessity of slaughtering cattle in a cool condition, and consequent thorough bleeding, is obvious. The flesh of a healthy and well-fed animal is of a bright colour and firm to the touch. The fat should be of a yellowish white, and without blood stains.

It is unnecessary to state that every animal slaughtered is not always of the primest quality; although such animals cannot be condemned as unfit for food. The lean flesh of such inferior beasts is pale and flabby, while the fat is of a bloody appearance. To improve the colour, bleeding is often resorted to. This is done by either cutting the tail or the large vein of the neck by means of a small circular blade inserted in a handle of steel. When the operator is satisfied that a sufficient quantity of blood has been drawn from the animal, the flow of blood is stopped by sewing up the wound. Although unlawful, it is a treatment that aged rams and ill-fed calves very often undergo. It is an old custom, and a very cruel one, causing unnecessary suffering to the animal, as there is strong reason to believe that this treatment is useless for the purpose to which it is intended. In the case of calves, a good meal of milk, given to them about an hour previously, will do all that can be done to whiten the flesh, and is, of course, the most humane treatment possible.

In slaughtering it should be the object of the butcher to cause as little suffering as possible to the animal. Much depends upon the skill of the operator in felling, especially in the use of the pole-axe. The pole-axe is an efficient instrument when skillfully used, but such skill is not always forthcoming in every butcher. There is, besides, a certain amount of danger accompanying the use of the pole-axe; should the animal not fall at the first blow, and the head rope be, perhaps, not too strong, the consequent struggles of the animal may result in its breaking loose, when, if it should turn "wild," the butcher and his assistants may expect a lively, and very often unpleasant time. This is the old method of felling, but we have now a very simple and effective instrument, namely, "Greener's Humane Killer," a bell-shaped apparatus, made so as to be held on the forehead of the animal by the hand, and in which is inserted a small bullet cartridge, which when discharged cause instantaneous death. It is by far the quickest method, as it does away with the necessity of pithing. The animal should be bled immediately it falls. This is done by partially cutting the large artery leading from the heart and lying just at the point of the lung cavity. The knife should not enter the cavity, as, in such case, a quantity of blood flows in and smears the inside parts. Beasts are also bled by cutting the throat from ear to ear; this is not a good plan, bleeding by the heart artery is by far the best and most effective for bullocks. Calves and sheep are treated in this form by the neck veins; this is done to prevent the necessity of trimming the shoulder parts, the extreme neck parts in the case of calves and sheep being of the least value.

In dressing, the skin should be taken off and offal taken out as quickly as possible for, in all weather, the sooner a carcase can get cold the better.

In wiping the carcase a cloth rung out of very hot water should be used. In no case should a quantity of cold water be used over a carcase, as it tends to give it a dull appearance and renders it more liable to get putrid if kept for a period. The following rules may be summed up as a guide to thorough slaughtering, viz.:—1. Proper rest for the animal; 2. Instantaneous death in felling; 3. Thorough bleeding; and 4. Quick despatch in dressing."

PREPARATIONS FROM MANIOC OR CASSAVA.

Manioc, the tuberous roots of *Manihot utilissima*, is generally consumed by the people of this country after cleaning and boiling, and few know of other and more wholesome preparations.

In order to prepare what is known as *Cassava meal*, the tubers, after having been washed, are divested of their dark coloured rind by being peeled with sharp knives. The peeled roots are then reduced to a coarse meal by being pressed against a rapidly-revolving wheel covered with a copper or tin grating surface, or they may be rubbed down to meal by means of a flat tin grater nailed on a board. In the latter case, however, the operation is very laborious, but still a large proportion of the Cassava meal made in the island of Dominica and elsewhere is prepared in this tedious way; the natives fix the large flat grater against a tub, and, leaning over it with tubers in each hand, they grate quickly and rhythmically to the sound of a drum, and it is said that they are encouraged to extra exertions by the stimulating influence of inspiring local songs, and more often than not by large portations of intoxicating drinks! The pulp which is produced is put into bags and pressed so as to force out the poisonous juice. The Indians of South America and Dominica do the pressing by means of curious baskets called "matapies." These baskets are made of plaited strips of the long smooth stems of a native plant closely allied to that producing arrowroot.

When empty the matapie is long and narrow, but when filled with the grated roots it becomes short and thick. It is then hung to the branch of a tree and heavy weights are attached to the lower end. The baskets then become longer, and by the constricting pressure most of the juice is forced out. Afterwards the meal is sifted by means of sieves, which separate the woody fibres and the small portions of the roots that have not been properly grated. The meal is then dried rapidly in large, shallow, flat iron pans set in masonry, with a flue passing underneath so as to conduct the heat from a wood-fire. The meal is spread thinly in the pan and constantly moved backwards and forwards with a wooden rake. The heat must not be so great as to brown the meal, the object being not to bake the product but to dry it. In the process of drying any remaining traces of the highly-poisonous juice are rapidly dissipated. "Cassava bread" is the name given to the thin round cakes made of the wet meal and dried on hot plates or on flat pieces of tin held over the fire.

Cassava starch is considsred a very superior quality of starch, and as it can be made cheaply, it should prove a suitable occupation for the natives of this country. The method of preparation is very simple. The grated Cassava meal is stirred up with water, and then passed through sieves. This is done several times so as to wash the starch clean, and the mesh of the sieves is decreased in size after each working, so as to leave the starch free from any foreign substance. After the last washing the water is allowed to remain for a time, when the starch will settle at the bottom of the vessel. The clean fluid at the top is then drawn off or decanted, and the starch is dried in the sun.

Another preparation from manioc is what is familiar to all householders as *tapioca*. In describing the preparation of Cassava meal it will be remembered that the juice had to be forced out of the rasped roots by pressure. Now if this poisonous juice be allowed to settle, a considerable quantity of very fine storch will be deposited. The juice is poured off and the starch is heated on tin plates or in flat iron pans; the starch grains then swell up and burst and become agglutinnated together, thus forming the tapioca of commerce, which is a large export from Brazil. The starch grains having been ruptured by the heat, they are partly soluble in water, and for this reason tapioca is especially valuable as food in cases of weak digestion.

There is still another product of manioc, and that is the substance known as *Cassareep*. The poisonous juice of the tubers of the bitter variety of Manioc, and which is invariably thrown away, is convertible into this substance which is of considerable value. The juice is simply boiled down until it becomes of the consistence and appearance of molasses. In this condition it is a powerful antiseptic, and it is capable of preserving all kinds of meal in a fresh condition for considerable periods. It is the basis of many celebrated sauces and of the well-known "pepper pot" of the West Indies. Thus by reason of the boiling process the poisonous juice is convertible into a wholesome food product, for which there is usually a ready sale in England and elsewhere. As the juice of the bitter Cassava contains so much of poisonous prussic acid, the greatest care must be taken to keep it away from children and animals. Many deaths have brought about by carelessness in the disposal of the juice, so that too great precaution cannot be taken to prevent accidents. It may be mentioned that the Indians of Guiana use the chillies known as "red pepper" steeped in rum as an antidote to the poison.

NOTES FROM A TRAVELLER'S DIARY.

So much has of late been talked about and written on the subject of agricultural education in this island, that I think it the duty of every one, who takes any interest in it, and who knows something about it, to express his views clearly on the subject, so as to keep the public well informed of the *pros* and *cons* of the question.

The Agriculturist, whether planter or "goyiya," has to direct his attention to the soil, and it is necessary for him to know what is its nature before he sets to work to cultivate it. It is not my intention to write a treatise on soils, but anybody who is acquainted with what is taught about soils in text-books on Agriculture, will admit that all scientific facts regarding them, explained in as simple a manner as possible, will be of immense benefit and interest to those who have to do with the soil.

Again as Agriculture is the art of cultivating the soil so as to produce crops from the various plants of use to man, it is necessary for the cultivator to have a knowledge of all that concerns the life of a plant. Some knowledge of Botany, therefore, will also be of material benefit and interest to him. And so with other subjects allied to Agriculture, and which go to constitute a complete course of study as imparted in Agricultural Schools and Colleges.

Propagation of plants; climate as affecting the growth of various crops, manures, rotation of crops, drainage, irrigation, tillage operations, pruning, budding and grafting, treatment of cattle in health and disease. &c., are subjects about which the Agriculturist ought to know something. A knowledge of all these will at least enable him to go about with his eyes open, while the influence that he could exercise on the people among whom he moves, is from an educational point of view, incalculable.

Perhaps much of what I have said so far may appear to be out of place in dealing with the question of the Agricultural School of this island, which is at present engaging the serious attention of Government. So much ignorance, however, has recently been displayed even in the very first principles of Agricultural education by some of the leading men of the island, in whose hands the welfare of the people lies, that it is but right I think that the public should be given an idea of the kind of knowledge which is imparted under the subject of Agriculture.

The present agitation for the "mending or ending" of the Colombo School of Agriculture originated, as we all know, on a motion by the Hon. the Tamil Member of the Legislative Council, in which he wanted to make out that the Agricultural School was an unqualified failure, and that, therefore, it should be done away with. If I remember right, it was then mentioned that "English Agriculture" was of no use to this island, and that the natives knew more about the cultivation of coconuts and other crops than Englishmen. As instances it was mentioned that an Englishman once ordered his coconut trees to be washed with soap and water, and that an Agricultural student did not know the distance at which coconuts should be planted!

All these utterances were at the time considered to be amusing enough and merely put down to ignorance of the real state of affairs. Matters, however, have now turned serious, and from all that I could gather there are many others who are adopting the ideas of the Hon. the Tamil Member, and who are bent upon making an end of the School of

Agriculture. It must, however, be encouraging to those who are immediately concerned in the welfare of this useful institution, to know that we have a wise, shrewd and far-seeing ruler, who will not be easily led away by the crude ideas of others. H.E. the Governor, however, does not yet appear to have been informed of all that has been done by the Agricultural School. In his speech at the late Agri-Horticultural Show at Nuwara Eliya, His Excellency alluded to the School of Agriculture, and we were told that a Commission had been appointed to inquire whether the School should be "ended or mended." It is also satisfactory to find that His Excellency is convinced that some system of Agricultural education is necessary for this island, and such a system, he hopes, will be devised by the Commission.

I do not say that the Agricultural School has so far been altogether a success. There are many useful things which it might have done, and upon which I mean to comment later on. But it is at the same time incorrect and unfair to say that the School has altogether been a failure. It will then be of interest to inquire at this stage what the School has done so far, and to what extent it has been of benefit to this island.

We will begin with coconuts, as this product was prominently referred to in the Legislative Council by the Hon. the Tamil Member stating that the Agricultural students had not been taught how to plant them. It will be of interest to those concerned to learn that a very useful pamphlet on coconut plantation has been compiled in Sinhalese, and published some years ago by a student of the Colombo School of Agriculture. This pamphlet fully deals with the subject. I know personally that many a native planter has been greatly benefited by this little work. The Sinhalese press spoke very highly in its favour. The improved system of coconut cultivation at present noticeable in some parts of the island, especially in native gardens, is, I make bold to say, in a great measure the due to influence of the School of Agriculture. An alarm was raised in some quarters of the islandsome time ago that the coconut palm was attacked by a serious leaf disease which threatened to destroy it altogether. The School of Agriculture promptly came to the front on this occasion, and by careful investigtion and publication of much useful information on the subject, soon dispelled all fear of any such possible calamity and gave an impetus to more liberal cultivation. One of the oldest and most experienced journalists of the day then wrote a leader on the "Progress of Agriculture," in which he highly complimented Mr. Green, the founder of the School of Agriculture.

"TRAVELLER."

INSECT PESTS.
(Continued).

Insects are remarkable for the fecundity of each species as well as for the great number of species. If all the progeny from a single pair of almost any species of insect were allowed to survive long enough to procreate, but very few years would elapse in a land before that particular species would quite exterminate itself with all that it fed upon, so immensely superabundant would it have become. The myriads upon myriads of locusts which overrun this country are known to all, and yet these locusts connot be called remarkably prolific insects. The number of eggs they lay is small compared to the number laid by many other insects; at the most it is not over one hundred and fifty. The number of individuals which might arise from one aphis during the course of a single season is almost incaculable. It amounts to billions of billions, numbers entirely beyond human comprehension. If, according to Dr. J. A. Lintner, in speaking of the Hop Aphis (*Phorodon humili*), every individual should attain maturity and produce its full complement of young (which, however, can happily never occur in nature), we should have as the number in the twelfth brood alone, disregarding those of all the preceding broods (thirteen broods in one season have been observed) no less than 10,000,000,000,000,000,000,000 (ten sextillions) of individuals. Figures in a case like this fail to convey any adequate conception.

The writer quoted, to impress the enormity of the number, makes the following computation, using space and the velocity of light, which is about eleven and one-fifth million miles per minute as his measures: "Were the brood marshalled in line with ten individuals to the linear inch touching one another, the procession would extend to the sun (a space which light traverses in eight minutes) and beyond it to the nearest fixed star (traversed by light only in six years) and still onward in space beyond the most distant star that the strongest telescope may bring to our view, to a point so inconceivably remote that the light could only reach us from it in twenty-five hundred years!"

Aphides are small insects and an individual inflicts but an infinitely small drain on the sap of a plant. But when this drain is magnified a million times, the loss to the plant is sadly apparent. The number of aphides infesting a certain cherry tree, ten feet in height, was once estimated to be twelve millions, or more than seven times the total population of Cape Colony. The number which are often seen congregated on a single head of cabbage must be over one hundred thousand.

VORACITY AND DESTRUCTIVENESS OF INSECTS.

Not alone are insects remarkable for their incalculable numbers, but for their extraordinary voracity and rapid growth as well. Mr. L. Trouvelot, a French naturalist, in studying one of the silk worms (*Telea polyphemus*, Cram.) found that the larva when full grown weighed four thousand one hundred and forty times as much as it did when hatched from the egg; and that during its growth it had consumed food to the amount of eighty-six thousand times its original weight. If a man grew in a similar proportion, he would weigh twelve tons and consume two hundred and fifty tons of food. Another writer mentions a flesh-feeding larva which consumed two hundred times its weight in one day, and a certain caterpillar which increased in weight ten thousand times in thirty days. The losses incurred through the ravages of insects are

enormous. In 1893, the estimated losses to grain crops in the Cape caused by "locusts and other plagues" were nearly twenty per cent. of the harvest for mealies (Indian corn), about fourteen per cent. for wheat, and from seven to twelve per cent. in the case of other cereals. Some of this loss was due to diseases, but probably insects were responsible for a loss of at least ten per cent. of the total harvests, and for very much more in the case of mealies.

The annual loss through insect ravages in the United States is said to average one-tenth of the crops. Mr. B. D. Walsh, at one time State Entomologist of Illinois, thirty years ago estimated that insects annually inflicted a loss of no less than sixty million pounds sterling in the country, and subsequent writers think his estimate a moderate one. Most certainly these great losses to the agriculturist cannot be entirely checked, but to some extent they are preventable, and to this extent they should be prevented.

POTASH MANURES AND THE NEED FOR SPECIAL POTASH FERTILIZERS.

Many experiments may be quoted which show that active potash manures produce increase of crops on soils that already contain potash in plenty. Hence, though a deficiency in a soil necessarily points to its requirement in the manure, the presence of abundant potash in the soil by no means proves that potash manuring is unnecessary. Medium soils and clay soils may, in many cases, require potash manures, just as surely as light soils and peaty soils; and, without actual experiment, the assumption that potash manures are not required does not appear, in view of these experiments, to be warranted in regard to any soil.

And even in soils where farmyard manure has been liberally applied, there is no sufficient ground for assuming that artificial potash manures, in readily available forms, may not be applied with advantage.

In the popular assumption that potash manures are not required on clay soils, the fact has been overlooked that the nature of the manure required is determined in much greater degree by the kind of crop grown than by the character of the soil. All kinds of ordinary soils possess, in greater or less measure, the chemical constitution and physical characters that are required for the growth of any crops that are suitable to the existing conditions of climate. But it has been proved by numerous practical experiments and observations that crops differ greatly in their power of utilizing the several constituents contained in the soil. Some crops have a difficulty, in most soils, in providing themselves with enough nitrogen, some in providing themselves with enough phosphoric acid; others are unable to obtain sufficient potash. It follows that the substance which plants take up influence and produces the greatest increase of yield when applied to them in readily available forms in manure.

There are various sources from which the soil may be replenished and the crops provided with potash. In the first place there is farmyard manure produced by the consumption of cakes and other foods rich in potash. Were the supply of potash from this source abundant enough and cheap enough, none other would be required. But great as is the total quantity of farmyard manure that is available, it is not adequate for the purpose. The straw or litter which is generally associated with cattle manure contains a considerable percentage of mineral food. The ash ingredients in straw amount to about 5 per cent or about 112 lbs. per ton, of which 15 to 30 per cent is potash. Taking the mean of a very large number of analyses of farmyard manure, it may be said that in the ash of well-rotted dung, the amount of potash is from 5 to 7 per cent, that is, one ton of manure contains only from 9 to 15 lbs. of potash. Heiden calculates that 25 tons of farmyard manure would not suffice to restore the potash removed by an ordinary rotation of crops sold off the land, even if every ounce of potash in the manure were to find its way into the roots of the crops, which is not possible. More probably nearly double that quantity would be required to make good the loss. It is hardly necessary to say that so large an application of manure is very rarely customary, and that in general farming practice there is a large deficit to be made good by the application of artificial manures. This is especially the case in this country where litter, which supplies the bulk of the potash of farmyard manure, is practically entirely absent, and where the manure generally purchased has, as a rule, suffered much from exposure to sun and rain.

Moreover, on many soils and especially on light sandy and on peaty soils, the policy of an enlightened management would aim beyond the mere restoration to the soil of the potash removed by the produce of the land carried off it. As they are always deficient in potash, it is a necessary condition of good cultivation, if any steps towards their improvement are to be taken, to endeavour to enrich them by adding to their deficient stock of phosphoric acid and potash. For such a purpose applications of farmyard manure alone are insufficient.

The chief commercial manures which are sources of potash are kainit, chloride of potash, and sulphate of potash. We shall refer to these and give full details regarding composition, price, &c., in our next, but in the meantime would wish to refer to the use of potash manures as a means of enriching cultivated soils in another sense.

A very important aspect of potash manuring is that connected with the growth of certain leguminous crops, and their method of obtaining nitrogen. It is only within the last few years that the very important discovery has been made that certain kinds of plants are able to draw upon the air for their stock of nitrogen. Hence, a very cheap way of manuring land with nitrogen is to grow such crops, and then plough them in, so that the nitrogen they obtain from the air in the course of their growth may be added to the soil, and thus furnish a store of nitrogen for other plants which do not possess this property. Such plants, however, in order to grow luxuriantly, require to be well supplied with the two mineral ingredients, potash and phosphoric acid. To manure such crops with costly nitrogenous manures is simply to waste money, and to neglect one of the best means at our command of enriching the soil in nitrogen. The growth of leguminous crops, therefore, is a valuable

means of manuring the soil with nitrogen. The more the growth of these nitrogen-collecting crops is promoted, by the application of liberal quantites of potash and phosphatic manures, the greater will be the quantity of nitrogen drawn from the air.

It was on this principle that the famous experiments of Dr. Schultz-Lupitz in Germany were based. He grew leguminous crops on light soils, and, by a liberal application of potash and phosphates, he enriched the soils not only in these minerals, but also in the nitrogen collected by the crops from the air, and thus succeeded in converting poor and barren soils into soils of fine fertility, capable of growing very goods crops of suitable kinds.

It would be difficult to exaggerate the importance of this discovery for the future of agriculture. It is well known that what is called the "condition" of soils, or their capacity for growing large crops, is in very great measure dependent on the amount of nitrogen they contain. No substance in soils is more generally deficient, and none is more easily exhausted. While mineral substances such as potash and phosphoric acid are firmly held by soils, nitrogen, in the form of nitrates, is washed largely into the drains every winter. In all regulary cropped soils, unless heavily manured, the nitrogen suffers a steady decline, and the soil becomes constantly less productive. The nitrogen can of course be restored by frequent and abundant manuring, but this can only be done at a great expense. No other manurial substance costs so much as nitrogen, and none is so apt to be wasted in the application; hence enormous sums are paid every year for nitrate of soda, sulphate of ammonia, and other manures intended to supply the soil with nitrogen. But it has now been shown that the nitrogen in soils can be very largely increased without any such expenditure. The growth of suitable leguminous crops, such as clovers and vetches, is a certain means to that end. These crops can be grown successfully on most soils without nitrogenous manures, provided they be supplied with abundant potash and phosphoric acid. Large crops can thus be obtained, and whether they be consumed on the land or cut and removed from it, the root residue left in the fields enriches the surface soil so much in nitrogen that its fertility and productive capacity are greatly increased. The effect of the growth of a good crop of clover in promoting the subsequent growth of a large crop of wheat has been long known, Schultz-Lupitz has clearly shown that the same principle may be applied not only to assist the growth of one particular crop, but also to raise more permanently the condition of the soil, and thus to convert worthless soil into fruitful fields. The use, therefore, of potash and phosphatic manures applied to the clover and vetch is not only the production of an increase of these crops, it is also a means of adding, without further expense in manures, a large addition of nitrogen to the soil in the valuable form of an accumulation of organic matter capable in great part of rapid decay, and thus of accumulating such a store of fertility as will result in the subsequent production of large crops.

FRUIT CULTURE.

[The Department of Agriculture of Cape Colony has lately issued a "Manual of Practical Orchard Work" by P. MacOwen and Eustace Pillans. The subject of fruit culture is most admirably treated of in this little work, and, as we consider (what everyone will readily admit) that there is a great deal of ignorance of what may be called the first principles of fruit culture in this country, we have compiled a paper on the subject from the Manual referred to, and have no doubt that many landowners will be thankful for the valuable information which we are able to offer them.—ED. *A.M.*]

The Artificial Character of Modern Fruit Trees.

1. Cultivation implies, first, a previous knowledge of the nature and constitution of the living being we propose to care for, and secondly, a previous knowledge of the soil and atmosphere in which it holds its dual life. It is only by such preknowledge that the cultivator can suit the conditions of growth to the wants of the thing to be grown, and thus place it in the best possible position for fulfilling the history of its life. Nothing short of this work, done of set purpose and as the outcome of exact knowledge, can be called *cultivation*.

2. But it is something more than this. It is not enough to reproduce plants in the precise form in which they exist in nature. Firstly, the cultivator, for his own benefit, aims at guiding and controlling the growth of certain plants so as to make them develop very differently from their normal original condition. Thus in one plant he endeavours to obtain seeds of large size and bland taste, in another the effort is to do away with seeds as far as possible and produce a large succulent fruit, in others, shortening of the axial growth, and great enlargement of the leaves is aimed at. The plant then with certain limits is, like clay in the hands of the potter, capable of being remodelled, by causing this or that organ to take on an excessive and unusual development, without at the same time interfering with the balance of functions necessary for its general health. This complex art is one great part of *cultivation*. To practise it with success obviously demands something more than the loose, popular notions of plant-life, which are picked up without special study or thought, or come by imitating the traditional methods of our neighbours.

3. Secondly,—For many hundreds of years a close watch has been kept upon the seedlings arising in the reproduction of all cultivated plants. Whenever a sport or other chance variation has appeared, presenting characters of a desirable kind, the gardener has quickly to detect it, and to give it permanence by such methods as budding and grafting which are unfortunately almost unknown in Ceylon. And this continual watchfulness, awaiting the chance of betterment by natural variation has produced the kinds of fruits approved and cultivated all over the world, so that in fruit culture as with all knowledge, we are today the heirs of countless benefactors who have preceded us and handed down to us their best results. It must, therefore, be always borne in mind that the objects of our culture are distinctly artificial products obtained by centuries of selection and variation, and do not exist as natural forms of vegetation, nor can they put up with the conditions that suffice for the latter. As soon as skilled care ceases they cannot escape deterioration

and ultimately dying out. And this indispensable skilled care is orchard work or fruit culture —a special branch of cultivation which requires a special knowledge of principles and practice.

(*To be continued.*)

DR. KOCH'S RINDERPEST CURE.

The following is a reprint of a report (for which we are indebted to the *Agricultural Journal* published by the Department of Agriculture of the Cape of Good Hope) by Mr. Otto Henning, who assisted Dr. Koch during his investigations into rinderpest. Mr. Henning has lost no time in ascertaining the proper method of applying Dr. Koch's system of inoculation, and his report gives a very clear idea of the manner of operating, and we are sure our readers will be glad of the information with which we are able to supply them :—

Inoculation.—When rinderpest breaks out amongst a herd, the best plan is to inoculate with the bile at once.

Description of Inoculation.—The bile must be taken from an animal that has suffered severely or died from rinderpest. The latter is better, but then the bile should be taken as soon as the animal dies, and, above all, before decomposition has set in.

Removal of the Bile.—To remove the bile the animal must be laid on its left side. Afterwards the skin and flesh along the left side must be cut through with a clean, sharp knife. A man sitting across the chest of the animal must now hold and raise the ribs with his right hand. By doing this the gall bladder, which is located immediately under the right ribs, becomes visible. After this the same man must, with his left hand (which must be clean), take hold of the gall-bladder at the bottom and raise it slightly.

A second man, with a small clean knife in his right hand, and in his left a clean cup or glass, now removes the bile in the following manner: Putting the cup againt the gall-bladder, let a small incision be made with the knife, so that the fluid can flow into the receptacle. Great care must be taken that no blood or yellow water, that may perhaps be among the diseased intestines, runs along with the bile. The man who cuts through the skin and flesh to get at the bladder must also take care that he does not cut into the stomach or intestines, otherwise the fluid in the gall-bladder will becomes unfit for use.

Bile suitable for inoculation should be dark or dark-green, and must not have an offensive smell. Yellow or dark-brown bile, and which contains shreds of the gall-bladder, is poisonous and unsuitable. Bile which gets mixed with the intestines on removal can naturally not be used.

The quantity of bile necessary for inoculation is 10 cubic centimetres—that is, one-third of an ounce, or about a third of a tablespoonful. If less than this quantity is used the result is uncertain.

The following day there is a swelling on the spot where the injection has taken place, which gradually disappears in the course of a week or two. This is sometimes bigger than a man's fist.

Sores only occur when the hands or instruments of the operators are dirty, or when the bile smells badly.

The quantity necessary to inoculate a beast effectively being so great, syringes must be used. And, therefore, I am sorry to say that these must be first imported. The Free State Government has cabled to Germany for some thousands, and their arrival will immediately be made known, so that farmers can carry out the inoculation in the proper manner.

How to Make the Injection.—The animal must be thrown upon the ground and its legs tied. The best place to inject is between the front legs, as there the skin is thin and loose.

The syringe is filled with gall, and the needle is then stuck deep into the skin, so that the point lies loosely between the skin and the flesh. The bile is then slowly injected and the hole made by the needle pressed together by the thumb and second finger of the left hand. The needle is then withdrawn and the fluid under the skin well rubbed in, so that it cannot escape through the incision in the skin, which would make the inoculation ineffective.

I have to add that this mode of inoculation will only prove effective in the case of animals which have not yet had the disease. It is useless for infected animals.

Professor Koch has not yet concluded his experiments, and he hopes in about a month's time to make known other methods of salting animals. By that time syringes will probably have arrived, and it will afford me much pleasure to prepare the inoculating fluid and personally instruct framers how to use it.

N.B.—It is of great importance that all sick animals, whether they show symptoms of infection before or after inoculation, shall be immediately isolated from healthy animals, as animals inoculated with the bile are not immune until after about ten days.

SOME CROP NOTES.

Tobacco.—There is no crop grown which varies so much in quality, because of the soil upon which it is grown and the fertilizers used, as tobacco. For a leaf of high quality for smoking purposes it is essential that the soil be light and rich in vegetable matter. A low, rich clayey soil will produce a rank and heavy crop, but will not produce tobacco of fine quality. The fine gold-leaf tobacco of North Carolina, so highly prized for cigarettes, is grown upon a light gravelly soil. A red clay produces sometimes a fine, rich mahogany-coloured leaf of high value. Limestone soils, too, will produce tobacco of high grade.

The heaviest crops, though not the highest in quality, are grown after a leguminous crop such as beans. The next year with proper fertilizing the same land will bring a crop of higher value. Potash is of the utmost importance to tobacco, which consumes large quantities of it; but in order to obtain a leaf that will burn well, all the forms of potash salts which contain chlorine, such as the muriate (chloride) and kainit, must be avoided. The sulphate of potash is the form in which potash should be provided. Stable manure is preferably applied to the crop preceding tobacco, rather than directly to the latter. The most suitable fertilizer for tobacco should contain of available phosphoric acid, 7 per cent; potash,

10 per cent; nitrogen 3½ per cent. The use of dried blood manure upon tobacco has given very profitable results.

As most tobacco is used for smoking purposes, the chief aim of the grower is to obtain a leaf with good burning qualities. Heavy loam—clay or peat soils will not do this. This plant being of tropical origin, a warm soil is essential, and one with but moderate quantities of organic matter produces the leaf of finest texture. Rank organic manures, tankage, fish, &c., must be avoided, as well as all materials containing chlorine.

GENERAL ITEMS.

The *Gazette of India* contains a series of lengthy Resolutions dealing with the recommendations of the Agricultural Conferences held in 1893 and in 1895-96. One of these—the sixth deals with the subject of agricultural education in country schools. For the present the Government of India consider the following conclusion to be justified by the discussions which have been held:—(1) That agricultural degrees, diplomas, or certificates should be placed on the same footing as corresponding literary or science degrees, etc., in qualifying for admission to Government appointments, and more particularly those connected with land-revenue administration; (2) that there should be not more than four institutions giving a high-class diploma, *viz.*, at Madras, Calcutta, Bombay, and some places in the North-Western Provinces, and that these should be utilized by other provinces; (3) that the diploma should eventually be compulsory in the case of certain appointments, *e.g.*, agricultural teachers at training schools, assistants to the Director of Agriculture, etc.; (4) that the practical instruction of candidates for certain subordinate appointments at a school-class or an experimental farm should be further considered; (5) that the special school course leading up to the agricultural diploma, degree or certificate, is required; (6) that the practice of allowing school-masters either before or after appointment to pass through a course of a few months on a Government farm is one which deserves consideration.

The Department of Land Records and Agriculture in the North-West Provinces and Oudh have issued a bulletin on a new method of tree planting, in which it is advised that when one to two year-old trees are planted out, the roots should be cut back to stubs about an inch long, and the trunk pruned to a branchless whip of from one to three feet high. It is said that by this system the roots grow directly downwards and avoid the drought which is so disastrous to young plants when planted out in the ordinary method. It is directed that the roots be cut cleanly in a horizontal plane, a hole two inches in diameter be drilled in the ground and the earth trampled close round it. Experiments at the Botanical Gardens, Saharunpore, have proved that the new system answers admirably for fruit trees, such as the apple, pear, vine, peach, and plum, provided they are operated on *when dormant* It is not recommended for ever-green fruit trees, such as mangoes, lecchis, oranges, loquats, etc.

The attention that is paid at Birmingham to the encouragement of the art of preserving eggs is as commendable as the methods for attaining the end in view are various and peculiar. This year the winning collection had been simply wiped over with white of egg, and marvellously sweet and fresh their yolks and whites looked, considering that they had reposed at Bingley Hall since August 1st. Twelve months ago the prize dozen had only been rubbed with butter, wrapped in paper, and packed in lime, such processes being simplicity itself and proving conclusively that the disagreeable methods of coating the shell with olive oil and with beeswax are superfluous and unnecessary. It may be added that the second prize collection this year was merely coated with white of egg and packed in flour.

Lord Arthur Cecil writes as follows in the *Live Stock Journal Almanac* for 1897 with reference to the shoeing of horses:—

First of all, then, the one golden law to be observed is that nothing whatever should be cut or rasped from the under surface of the healthy foot. beyond the loose flaps which occasionally become detached from the frog. In a contracted or unhealthy foot it may be necessary occasionally to open the heels a little, but the less this is done the better.

Secondly, the whole of the surface of the bottom of the wall of the foot should be potected by iron, though the heels should have room to expand. Nothing, in my opinion, is so injurious to the foot as too closely-fitting shoes.

Lastly, as regards shoeing, it is a mistake to suppose that the knife or rasp should *never* be applied anywhere. Horses' feet do not all grow exactly rightly—owing, I believe, to over-civilisation—and each foot requires individual study in rasping or paring round the edges to reproduce the wonderful equality and rotundity of the natural foot, which generations of domestication have as much lost as human finger-nails must have altered from talons.

The *Veterinary Journal* referring to rinderpest wrote lately as follows:—

"Various observers have stated that they have discovered organisms which they consider the cause of the disease. Semner describes a streptococcus liquefying gelatine; Metchnikoff, a short bacillus with rounded ends, found in the intestinal ulcers and in the blood; Laweljeff, spore-bearing bacilli, which in cultures are transformed into isolated micrococci or arranged in chains, and he states that inoculation with these cultures induced rinderpest. Dr. Lionel Beale described a granular matter, which he considered to be living particles—germinal matter. He also thought that they constituted the morbid poison. But up to the present time there is no unanimity amongst observers as to what kind of microbe is the pathogenic one; we must, however, conclude that the disease is of a microbic origin, and, as in some other diseases, that an antitoxin or antiptomaine may be discovered. Let us hope that Prof. Koch will succeed in making this discovery, and thus gain the further admiration of the scientific world."

Since this was written Dr. Koch's discovery has been made.

The following is the Constitution of the Department of Agriculture, Queensland, which no one will dare say is undermanned:—

Minister of Agriculture ...The Hon. A. J. Thynne, M.L.C.

Under-Secretary in Agriculture ...P. M'Lean.

Instructor ,, ,,	.. E. M. Shelton, B.SC.
Colonial Botanist	...F. M. Bailey, F.L.S.
Government Entomologist	. Henry Tryon.
Curator, Botanical Gardens	...Philip MacMahon.
Overseers of Nurseries	...E. Cowley and D. Buchanan.
Fruit Expert	...A. H. Benson.
Chief Clerk	...Ernest Scriven.
Chief Inspector of Stock and Registrar of Brands	...P. R. Gordon.
Deputy do	...J. E. de Villers.
Director of Stock Institute and Government Bacteriologist	...C. J. Pound, F.R.M.S.
Veterinary Inspector	...W. C. Quinnel, M.R.C.V.S.

The strength of the Victoria Regia has been demonstrated by the fact that it has borne the infant son of Lord and Lady Leamington, who has been photographed while sitting on a leaf of this giant lily, the diameter of which was found by measurement to be 4 ft. 6 in. Another child photographed in the same position was found to weigh 51 lbs.

It is a popular idea that the seeds of many plants pass unharmed through the digestive canal of birds, and, being voided with the excrements, reach the ground in a peculiarly favourable condition for germination ; and this is generally believed to be especially the case of the mistletoe, the seeds, in this case, being deposited on the branches of the tree on which the mistletoe is parasitic. In a paper contributed to the *Transactions* of the Linnean Society, Mr. F. W. Keeble shows that this is at all events not universally the case with the *Loranthaceae*, especially with the Cingalese species of *Loranthus*. The species of this genus with tubular flowers which are natives of Ceylon are ornithophilous (visited by birds), the bird most effective in their pollination being a honey-bird, a species of *Nectarinia*. In the large-flowered species, the buds remain closed ; but when tapped, the corolla-lobes fly open with an explosion, and the pollen is scattered. The closing of the flower-buds appears to serve the purpose of protecting the pollen against rain, while the violent expulsion of the pollen aids in its carriage by the visiting birds, their beaks being frequently found to be covered with pollen after visiting the flowers. When the fruit is ripe, the bird eats the succulent portion only, wiping out the seeds with its beak on to a branch of the tree, to which they thus become attached by their viscid coating. If swallowed, the seeds are found to be digested and destroyed. —*Nature*.
